INTRODUCTION

One of the core objectives of the European Union (EU) is to improve the health of European citizens.

eHealth has the potential to empower citizens to better manage their health and disease, improve prevention, enable more accurate diagnosis and treatment and facilitate the communication between healthcare professionals and patients.

It can also contribute to a more equal access to healthcare while facilitating access to health information.

The eHealth Action Plan 2012-2020 identified the lack of awareness of eHealth opportunities and challenges for users as one of the barriers to wider uptake of eHealth solutions and proposed to support activities aiming at increasing citizens' digital health literacy¹.

This Flash Eurobarometer report No. 404 "European citizens' digital health literacy" aims to support this objective by assessing the extent to which Europeans already use the Internet and online resources to help manage their own health.

The report looks at the type of health-related information people most commonly look for, where they look for it and why they look for it. It then studies how satisfied they are with the health-related information they found, and how likely they would be to use the Internet to look for health-related information in the future.

This report also explores the reasons given by people who have not relied on the Internet, as to why they have not used the Internet to search for health-related information so far, what alternative means they have used, and whether they would use the Internet to look for health-related information in the future.

Finally, the report provides an overview of the level of Internet usage among Europeans, and also of the health of European citizens and other health-related issues (e.g. doctor visits, frequency of physical exercise).

¹ Digital health literacy is the ability to seek, find, understand and appraise health information from electronic sources and apply the knowledge gained to addressing or solving a health problem.

This survey was carried out by TNS Political & Social network in the 28 Member States of the European Union between the 18th and the 20th of September 2014. Some 26,566 respondents from different social and demographic groups were interviewed via telephone (landline and mobile phone) in their mother tongue on behalf of the European Commission, DG CONNECT. The methodology used is that of Eurobarometer surveys as carried out by the Directorate-General for Communication ("Strategy, Corporate Communication Actions and Eurobarometer" Unit)². A technical note on the manner in which interviews were conducted by the Institutes within the TNS Political & Social network is appended to this report. Also included are the interview methods and confidence intervals³.

Note: In this report, countries are referred to by their official abbreviation. The abbreviations used in this report correspond to:

* Cyprus as a whole is one of the 27 European Union Member States. However, the 'acquis communautaire' has been suspended in the part of the country which is not controlled by the government of the Republic of Cyprus. For practical reasons, only the interviews carried out in the part of the country controlled by the government of the Republic of Cyprus are included in the 'CY' category and in the EU28 average.

* * * * *

We wish to thank the people throughout Europe who have given their time to take part in this survey. Without their active participation, this study would not have been possible.

³ The results tables are included in the annex. It should be noted that the total of the percentages in the tables of this report may exceed 100% when the respondent has the possibility of giving several answers to the question.

EXECUTIVE SUMMARY

Use of the Internet to search for health-related information

- Around six out of ten respondents have used the Internet to search for health-related information within the last year. Of these, over half say they did so at least once a month.
- This percentage is highest in the 25-34 years age group and then decreases steadily.

Type of health-related information searched for on the Internet

- The main type of information searched for is general information on health-related topics or ways to improve one's health and more specifically especially information on **lifestyle choices** such as nutrition, physical activity, smoking, etc.
- In second place comes the search for information on a specific injury, disease, illness or condition and in particular the search for **information on the symptoms**.

Sources used and person for whom the information was searched

- No matter what kind of health-related information they look for on the Internet, the ranking of the different sources used is very similar, with search engines clearly ahead, followed by specific and dedicated websites including blogs and forums.
- A vast majority of respondents who used the Internet to look for general health-related information did so for themselves, no matter what kind of health-related information they looked for.

Quality of the information found on the Internet

- Over three quarters of all respondents agree that the Internet is a **good tool for improving their knowledge** of health-related topics.
- Nearly nine out of ten people who looked for health information online say they were **satisfied** with the information they found.
- Roughly half of the people who were not satisfied with the information they found say it was **not reliable**, that it was **commercially oriented**, or that it was **not detailed enough**.
- Eight out of ten people think that the health-related information they found online was **useful** and that it was **easy to understand**.
- 40% however, did not think the information came from a **trustworthy source**.
- The levels of satisfaction across the different elements varied significantly between the Member States.
- Relatively high numbers of people express satisfaction in the UK, Spain, Belgium, Austria and Finland, while relatively few do so in Slovakia, Slovenia, Lithuania, and Cyprus.
- A very substantial majority of people who previously used the Internet to look for health-related information say they would do so again.

Citizens' understanding of online health-related information

- Over nine out of ten people who used the Internet say they **know how to navigate** the Internet to find answers to health-related questions.
- More than nine out of ten respondents agree that their research on the Internet **helps them improve their knowledge** of health-related topics.
- Nine out of ten people agree that they **know how to use** the health-related information they find on the Internet.
- Over 80% also agree that they **know where to find** reliable health-related information on the Internet and that they can **distinguish high-quality information from low-quality** health-related information on the Internet.
- However, almost four out of ten people **do not trust** information from the Internet to make health-related decisions.

Alternative sources of health-related information

- Four out of ten people who did not use the Internet say that they don't need to search for health-related information, while a third say that they don't have access to the Internet.
- Two-thirds of people who did not use the Internet to look for health-related information did not look for health-related information through any means.
- Most people who obtained health information through means other than the Internet say they usually ask their doctor for this sort of information.
- Three out of ten people who did not previously use the Internet to look for health-related information say that they are likely to use the Internet next time.

MAIN FINDINGS

I. USE OF THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION

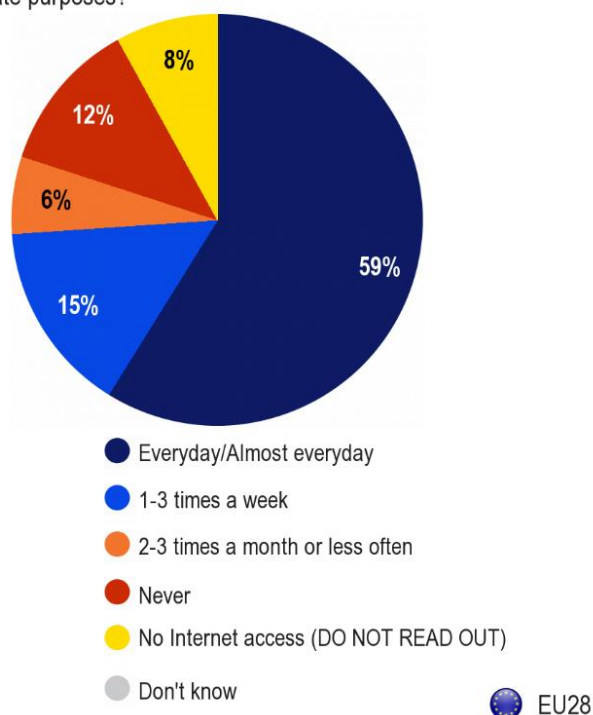

1.1. FREQUENCY OF INTERNET USE

– Eight out of ten people have used the Internet for private purposes within the last year –

Overall, at EU level, eight out of ten respondents (80%) have used the Internet for private purposes within the last 12 months. Around six out of ten (59%) have done so every day or almost every day on average. An additional fifth of respondents (21%) used the Internet, but less frequently: 15% used it 1-3 times a week and 6% used it 2-3 times a month or less often.

One person in five (20%) has never used the Internet, including 8% who spontaneously⁴ say that they have no Internet access.

Q1. On average, within the last 12 months, how often have you used the Internet for private purposes?

Base: All respondents

Looking at overall usage, respondents in the Netherlands (94%), Denmark (92%) and Sweden (92%) are the most likely to say they used the Internet over the last 12 months. Conversely, respondents in Romania (65%), Slovenia (70%) and Bulgaria (71%) are the least likely to have done so.

⁴ This item was not part of the list of potential answers provided by the interviewer. For methodological reasons, the mention "Do not read out" is systematically added next to spontaneous answers, throughout this report.

In all but three Member States, over 50% of respondents say that they used the Internet every day or almost every day, with the highest proportions in Sweden (82%), the Netherlands (79%), Denmark (77%) and Finland (71%). Conversely, Romania (44%), Italy (46%) and Slovenia (49%) are the three countries where less than half of respondents used the Internet on a daily basis.

Q1 On average, within the last 12 months, how often have you used the Internet for private purposes?

		Everyday/ Almost everyday	Two or three times a week	Approxim ately once a week	Two or three times a month	Less often	Never	No Internet access (DO NOT READ OUT)	Total - Has used the Internet	Total - Has NOT used the Internet

	RO	44%	11%	3%	3%	4%	27%	8%	65%	35%

Base: All respondents

The socio-demographic data show that:

- Men are more likely than women (65% vs. 54%) to have used the Internet every day.
- Unsurprisingly, younger people are much more likely to have used the Internet every day: 84% of 15-24 year-olds did so, compared to only 34% of people aged 55 and over.
- 71% of people who finished their education aged 20 or over used the Internet every day, versus 25% of those who left school aged 15 or below.
- While three quarters of employees (75%) used the Internet every day, less than half of people who are not working (47%) did so.
- 82% of people who say they know how to navigate the Internet to find the answers to their health questions used the Internet every day, compared with 64% of respondents who say they don't know how to do this.
- While 63% of people in a good state of health used the Internet every day, only 37% of people in a poor state of health did so.

Q1 On average, within the last 12 months, how often have you used the Internet for private purposes?

Base: All respondents

1.2. FREQUENCY OF USE OF THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION**– Around six out of ten people have used the Internet to search for health-related information –**

A majority of respondents (59%) say that they have used the Internet to search for health-related information within the last 12 months. Of these, 10% have done so once a week or more, 9% several times a month, 13% approximately once a month, and around a quarter (27%) have used the Internet less than once a month to search for health-related information.

Conversely, roughly four out of ten people (41%) have never used the Internet for this purpose.

Q2TT. Within the last 12 months, have you used the Internet to search for health-related information? This could include information on an injury, a disease, illness, nutrition, improving health, etc.

Base: All respondents

In the three following Member States, at least seven out of ten people have used the Internet to search for health-related information within the last year: the Netherlands (73%), Sweden (70%) and Denmark (70%). At the other end of the scale, Romania (47%) and Malta (49%) are the only countries in which less than half of the respondents say they have used the Internet for this purpose.

Q2TT Within the last 12 months, have you used the Internet to search for health-related information?
This could include information on an injury, a disease, illness, nutrition, improving health, etc.

		Yes, once a week or more often	Yes, several times a month	Yes, approx- imately once a month	Yes, approx- imately once every two months	Yes, a few times within the past year	No, never	Don't know	Total 'Yes'

	RO	13%	13%	9%	3%	9%	53%	0%	47%

Base: All respondents

The socio-demographic results show that:

- There is no significant difference between male and female respondents on this issue.
- Unsurprisingly, young people are more likely to have used the Internet to search for health-related information: 77% of 15-24 year-olds have done so, compared with 34% of people aged 55 and over.
- While 71% of people who finished their education aged 20 or above mention having used the Internet to search for health-related information, only 23% of people who left school aged 15 or under say the same thing.
- Three quarters of employees (75%) have used the Internet for this purpose, as opposed to 47% of people who are not working.
- Seven out of ten people (70%) who agree that the Internet is a good tool to improve their knowledge of health-related topics have used the Internet to search for health-related information, versus 29% of people who disagree.
- Over six out of ten respondents (62%) who believe they have a good level of health have searched for health-related information via the Internet, in contrast with four out of ten (40%) of those who have a bad level of health.
- Amongst respondents who claim to have a good knowledge of health-related topics, 61% have used the Internet to search for health-related information, versus 53% of people who believe they have a bad knowledge of these topics.

1.3. MAIN TYPE OF HEALTH-RELATED INFORMATION SEARCHED FOR ON THE INTERNET

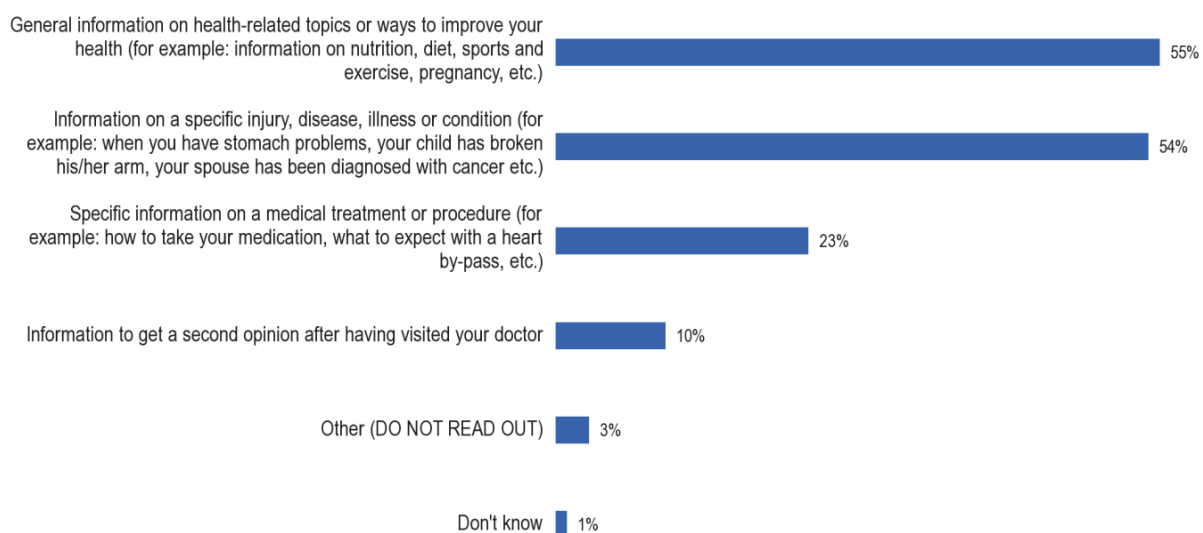

– Over half of the respondents used the Internet to look for general health information or for information about a specific injury or illness –

People who said that they had used the Internet to search for health-related information within the last 12 months were then asked what type of information they had looked for. They were allowed to give up to two answers from a list of four options.

Over half of the respondents (55%) say that they looked for general information on health-related topics or ways to improve their health. A similar proportion (54%) looked for information on a specific injury, disease, illness or condition.

Just under a quarter of people (23%) looked for specific information on a medical treatment or procedure, while a tenth of respondents (10%) used the Internet to look for information to get a second opinion after visiting their doctor.

Q3. Within the last 12 months, what type of health-related information did you look for on the Internet? You searched the Internet for... (MAX. 2 ANSWERS)

EU28

Base: Respondents who used the Internet to search for health-related information within the last 12 months (N=15598)

Looking for general information on health-related topics or ways to improve one's health is most common among respondents in Croatia (65%), Greece (65%) and Hungary (64%). On the other hand, in Lithuania (48%) as well as in France, Romania and Sweden (all 49%), just under half of the respondents who have used the Internet to search for health-related information within the last 12 months did so to look for such general information.

The highest proportion of respondents who looked for **information on a specific injury or condition** can be observed in Finland (70%), followed by the Netherlands, Sweden and the UK (all 61%). Conversely, around a third of people used the Internet for this purpose in Slovenia (32%), Cyprus (35%) and Malta (35%).

The proportion of respondents who used the Internet to look for **specific information on a medical treatment or procedure** ranges from 29% in Romania and 28% in Lithuania, to just 7% in Greece and 16% in both Cyprus and Hungary.

In most Member States, a relatively low proportion of respondents mention having looked for information **to get a second opinion after visiting their doctor**, with the highest proportions in Bulgaria, the Czech Republic, Malta, and Spain (all 14%).

Highest percentage per country		<i>Lowest percentage per country</i>					
		Highest percentage per item			Lowest percentage per item		

Base: Respondents who used the Internet to search for health-related information within the last 12 months (N=15598)

According to the **socio-demographic data**:

- Nearly two-thirds (64%) of respondents aged 15-24 mention having used the Internet to look for general information, while this proportion falls to 46% among people aged 55 and over. However, respondents aged 55 and over were more likely than 15-24 year-olds to look for specific information on a medical treatment or procedure (27% vs. 16%).
- Respondents who finished their education aged 20 or over are somewhat more likely to have looked for general health-related information than those who left school aged 15 or below (54% vs. 45%).
- Individuals with a long-term disease or health problem are more likely to have looked for specific information on a specific injury, disease, illness or condition (59% vs. 51%) or for specific information on a medical treatment or procedure (29% vs. 19%), but less likely to have used the Internet to look for general health-related information (47% vs. 60%).
- People who exercise at least once a week are more likely to have looked for general health-related information than those who exercise less than once a week (59% vs. 49%).

Q3 Within the last 12 months, what type of health-related information did you look for on the Internet?

You searched the Internet for...

(MAX TWO ANSWERS)

Base: Respondents who used the Internet to search for health-related information within the last 12 months (N=15598)

II. HEALTH-RELATED INFORMATION SEARCHED FOR ON THE INTERNET

Respondents who mentioned having used the Internet to search for each of the four types of information detailed above were then asked a series of four questions related specifically to that type of information: the specific information searched for, the frequency, the source used, as well as the person for whom this information was searched.

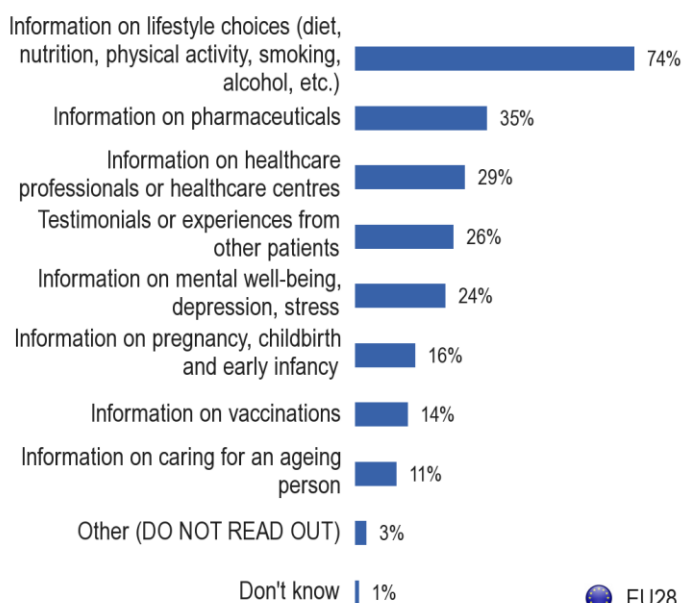

2.1. SPECIFIC INFORMATION LOOKED FOR, IN EACH OF THE MAIN CATEGORIES OF HEALTH-RELATED INFORMATION

Respondents were asked to detail which specific information they had searched, for each of the two main categories of health-related information. They were allowed to give multiple answers from a list of seven or eight options, which varied from category to category.

2.1.1. General information on health-related topics or ways to improve their health

Around three quarters (74%) of respondents who previously answered they had used the Internet to search for general information on health-related topics or ways to improve their health mentioned that they were looking for **information on lifestyle choices, such as diet, nutrition, physical activity, smoking, alcohol, etc.** This was by far the most commonly sought type of information. Over a third (35%) of people looked for information on pharmaceuticals, while around three out of ten (29%) looked for information on healthcare professionals or centres. Around a quarter of respondents say that they looked for testimonials or experiences from other patients (26%) or for information on mental well-being (24%).

Q4. More specifically, when trying to access general information on health-related topics or ways to improve your health, which of the following types of information did you look for? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents who searched the Internet for general information on health-related topics within the last 12 months (N=8591)

According to the socio-demographic data:

- Interest in different types of information appears to vary according to age: respondents in the younger age band (15-24 year-olds) are the most likely to say that they looked for information about mental wellbeing and lifestyle choices, or for testimonials. 25-39 year-olds are the most likely to have looked for information about childbirth and vaccinations. And 40-54 year-olds are the most likely to have looked for information about pharmaceuticals and healthcare professionals.
- Respondents who consider their level of health to be bad are more likely to have looked for information on pharmaceuticals (49% vs. 34%), on mental wellbeing (35% vs. 23%) and on healthcare professionals (39% vs. 29%). In contrast, people who consider they are in good health are more likely to have looked for information on lifestyle choices (75% vs. 67%), pregnancy and childbirth (17% vs. 7%), and vaccinations (15% vs. 7%).

Q4 More specifically, when trying to access general information on health-related topics or ways to improve your health, which of the following types of information did you look for? (MULTIPLE ANSWERS POSSIBLE)

	Information on lifestyle choices (diet, nutrition, physical activity, smoking, alcohol, etc.)	Information on pharmaceuticals	Information on healthcare professionals or healthcare centres	Testimonials or experiences from other patients	Information on mental well-being, depression, stress	Information on pregnancy, childbirth and early infancy	Information on vaccinations	Information on caring for an ageing person	Other (DO NOT READ OUT)	Don't know
EU28	74%	35%	29%	26%	24%	16%	14%	11%	3%	1%
Age

Base: Respondents who searched the Internet for general information on health-related topics within the last 12 months (N=8591)

2.1.2. Information on a specific injury, disease, illness or condition

Over three quarters (78%) of people who used the Internet to find information on a specific injury, disease, illness or condition looked for **information on the symptoms of a specific disease or illness**, while seven out of ten people (71%) looked for **information on how to treat the problem**.

Roughly four out of ten people looked for information on other possible treatments (42%), on pharmaceuticals (39%), or for testimonials or experiences from other patients (36%). Around a quarter of the respondents searched for information on medical tests (27%), and a tenth of respondents (10%) looked for emotional support in dealing with a health issue.

Q8. More specifically, when trying to find information on a specific injury, disease, illness, or condition, which of the following type of information were you looking for? (MULTIPLE ANSWERS POSSIBLE)

EU28

Base: Respondents who searched the Internet for information on a specific injury, disease or condition within the last 12 months (N=8395)

According to the socio-demographic data:

- Among respondents who searched the Internet to find information on a specific injury, disease, illness or condition, women are somewhat more likely than men to have used the Internet to look for information on pharmaceuticals (42% vs. 35%).
- Respondents with long-term health problems are more likely to have used the Internet to look for information on the results of medical tests (30% vs. 25%), on pharmaceuticals (42% vs. 37%) and on possible treatments (48% vs. 38%).

Q8 More specifically, when trying to find information on a specific injury, disease, illness, or condition, which of the following type of information were you looking for? (MULTIPLE ANSWERS POSSIBLE)

	Information on the symptoms of a specific disease, illness or injury	Information on how to treat a specific disease, illness or injury	Information on other possible treatments	Information on pharmaceuticals	Testimonials or experiences from other patients	Information on results of medical tests	Emotional support in dealing with a health issue	Other (DO NOT READ OUT)	Don't know

Base: Respondents who searched the Internet for information on a specific injury, disease or condition within the last 12 months (N=8395)

2.1.3. Specific information on a medical treatment or procedure

More than half of respondents who used the Internet to find specific information about a medical treatment or procedure looked for **information on pharmaceuticals** (58%) or on the **potential risks of a medical treatment or procedure** (54%).

Roughly four out of ten people say that they looked for information on lifestyle choices (41%) or for testimonials or experiences from other patients (39%). Around one third of people looked for information on healthcare professionals or healthcare centres (36%) or on alternative medicine (30%).

Q16. More specifically, when trying to find specific information on a medical treatment or procedure, which of the following types of information did you look for? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents who searched the Internet to find specific information on a medical treatment or procedure within the last 12 months (N=3561)

According to the socio-demographic data:

- Among respondents who searched the Internet to find specific information about a medical treatment or procedure, women are somewhat more likely than men to have looked for information on lifestyle choices (43% vs. 38%), pregnancy or childbirth (14% vs. 7%), testimonials (41% vs. 36%) or information on alternative medicine (35% vs. 24%).
- Individuals who say they exercise once a week or more often are more likely to have looked for information on lifestyle choices (44% vs. 33%).

Q16 More specifically, when trying to find specific information on a medical treatment or procedure, which of the following types of information did you look for? (MULTIPLE ANSWERS POSSIBLE)

	Information on pharmaceuticals	Information on the potential risks of a medical treatment or procedure	Information on lifestyle choices	Testimonials or experiences from other patients	Information on healthcare professionals or healthcare centres	Information on alternative medicine	Emotional support in dealing with a medical treatment or procedure	Information on pregnancy, childbirth and early infancy	Other (DO NOT READ OUT)	Don't know

Base: Respondents who searched the Internet to find specific information on a medical treatment or procedure within the last 12 months (N=3561)

2.1.4. Second opinion after visiting the doctor

Roughly three quarters (74%) of people who used the Internet to get a second opinion after visiting their doctor, looked for **information on a specific disease or illness**. Approximately half of the respondents also say that they looked for **information on their prescribed treatment** (52%), or on **other possible treatments** (50%).

Over four out of ten people (43%) looked for testimonials or experiences from other patients, and over a third say that they looked for information on the results of medical tests (36%), or on healthcare professionals or healthcare centres (34%). Around a sixth of respondents looked for information on pregnancy or childbirth (17%), or for emotional support in dealing with a health issue (15%).

Q12. More specifically, when trying to get a second opinion after having visited your doctor, which of the following types of information did you look for? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents who searched the Internet to get a second opinion after having visited the doctor within the last 12 months (N=1563)

According to the socio-demographic data:

- Individuals who left education aged 20 or over are more likely to have looked for information on their prescribed treatment (53% vs. 33% of people who left school aged 15 or below), or for information on a specific condition (77% vs. 64%).
- People who agree that the Internet is a good tool to improve their knowledge of health-related topics are more likely to have looked for most types of information, including information on how to treat a specific condition (76% vs. 62%) and on their prescribed treatment (54% vs. 36%).

Q12 More specifically, when trying to get a second opinion after having visited your doctor, which of the following types of information did you look for?
(MULTIPLE ANSWERS POSSIBLE)

	Information on a specific disease, illness or medical problem	Information on the prescribed treatment	Information on other possible treatments	Testimonials or experiences from other patients	Information on results of medical tests	Information on healthcare professionals or healthcare centres	Information on pregnancy, childbirth and early infancy	Emotional support in dealing with a health issue	Other (DO NOT READ OUT)	Don't know

Base: Respondents who searched the Internet to get a second opinion after having visited the doctor within the last 12 months (N=1563)

2.2. FREQUENCY OF SEARCH

– The frequency of search for health-related information depends on the type of information searched for, with the highest frequency for general information on health-related topics –

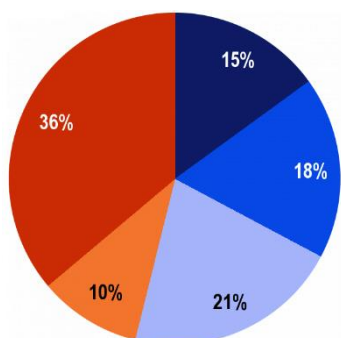

Respondents who searched for health-related information on the Internet were asked how often they did so, for each of the type of information they had mentioned. Although the base sizes are different, the graphics below show the differences in frequency of search, according to the type of information searched for.

About half of respondents who searched for general information on health-related topics or ways to improve their health (54%) and of those who tried to find specific information on a medical treatment or procedure (46%) did so **once a month or more often** on average.

This proportion was lower among respondents who looked for information on a specific injury, disease, illness or condition (at least once a month: 40%). Just above a quarter of respondents (29%) who searched for information to get a second opinion after having visited their doctor did so on a monthly basis or more frequently.

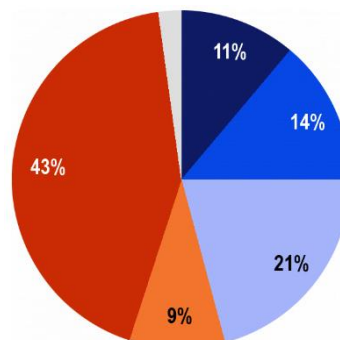

On average, within the last 12 months, how often have you used the Internet...

Q5. ...to access general information on health-related topics or ways to improve your health?

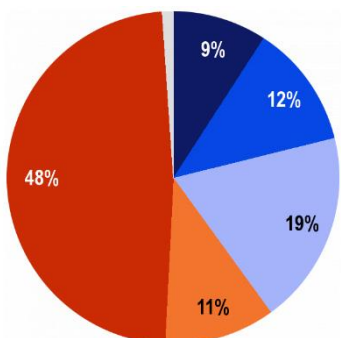

Base: Respondents who searched the Internet for general information on health-related topics within the last 12 months (N=8591)

Q17. ...to find specific information on a medical treatment or procedure?

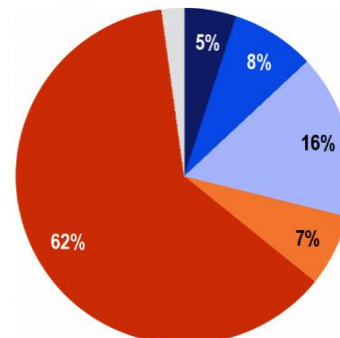

Base: Respondents who searched the Internet to find specific information on a medical treatment or procedure within the last 12 months (N=3561)

Q9. ...to find information on a specific injury, disease, illness or condition?

Base: Respondents who searched the Internet for information on a specific injury, disease or condition within the last 12 months (N=8395)

Q13. ...to get a second opinion after having visited your doctor?

Base: Respondents who searched the Internet to get a second opinion after having visited the doctor within the last 12 months (N=1563)

- Once a week or more often
- Several times a month
- Approximately once a month
- Approximately once every two months
- A few times within the past year
- Don't know

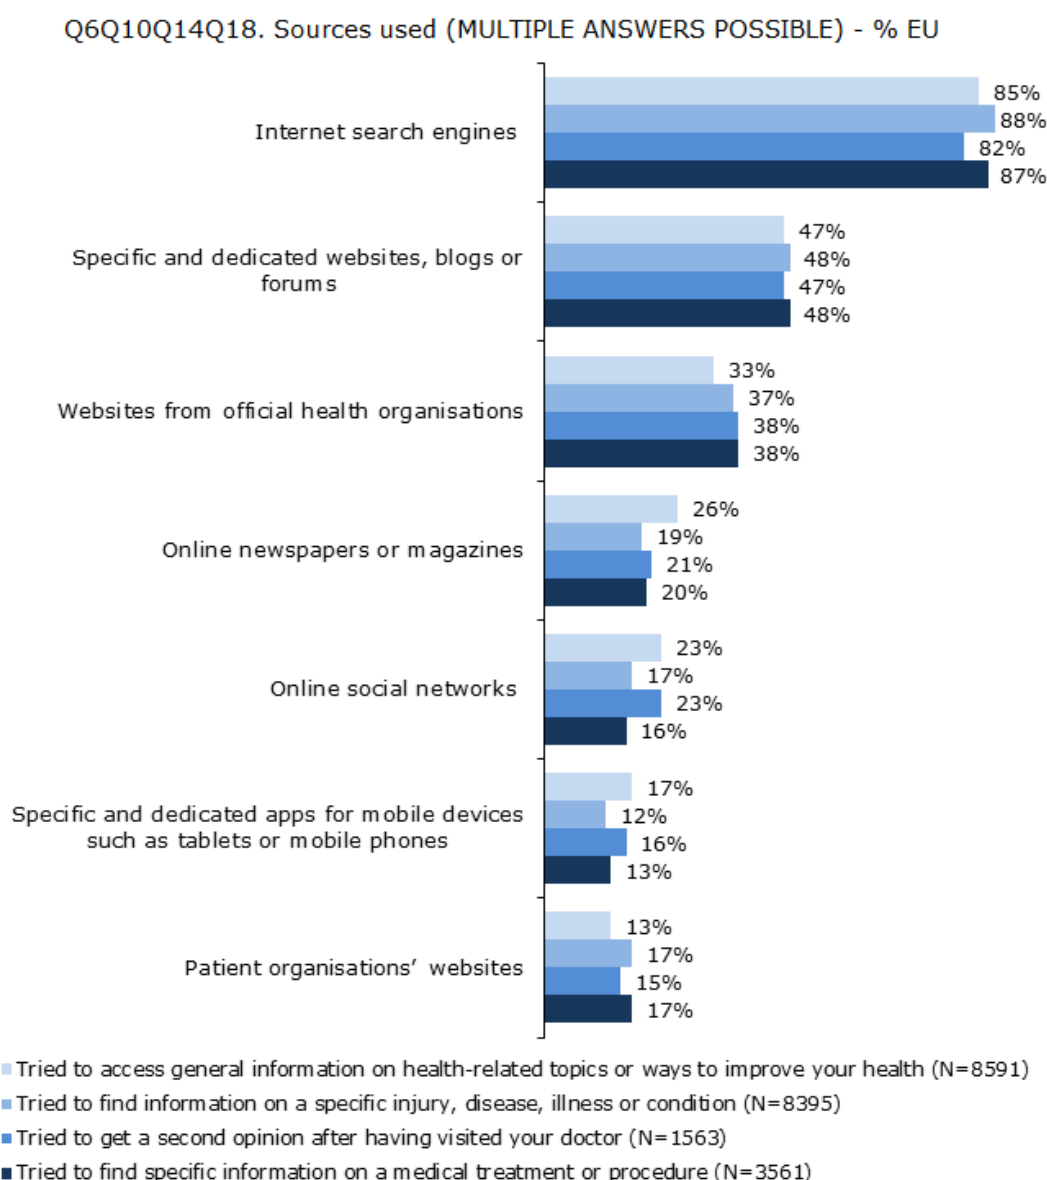

**2.3. SOURCES USED**

– The source used to find health-related information on the Internet doesn't vary much, with search engines clearly on top –

No matter what kind of health-related information they are looking for on the Internet, the ranking of the different sources used (from a list of seven options) is very similar.

The graph below shows the distribution of sources used, depending on the type of health-related information searched for online⁵. **Search engines** clearly represent the source most frequently used, no matter what type of information was searched for: between 82% and 87% of respondents who have searched for each different type of health-related information online have indeed used search engines to do so.

Specific and dedicated websites (including blogs and forums) constitute the second most used source, for all types of health-related information, with roughly half of people who looked for each different type of health-related information online. **Websites from official health organisations** like the Ministry of Health, the World Health Organisation, etc. are used by around one-third of respondents (between 33% and 38%). **Online newspapers or magazines** and **online social networks** come next, followed by **specific mobile apps** and **patient organisations' websites**.

Base: Respondents that searched the Internet for information on health-related topics (N=8591), on a specific injury, disease or condition (N=8395), to get a second opinion after having visited the doctor (N=1563), on a medical treatment or procedure (N=3561) within the last 12 months.

⁵ Please note that this graph presents proportions calculated on the basis of respondents who have used each type of information.

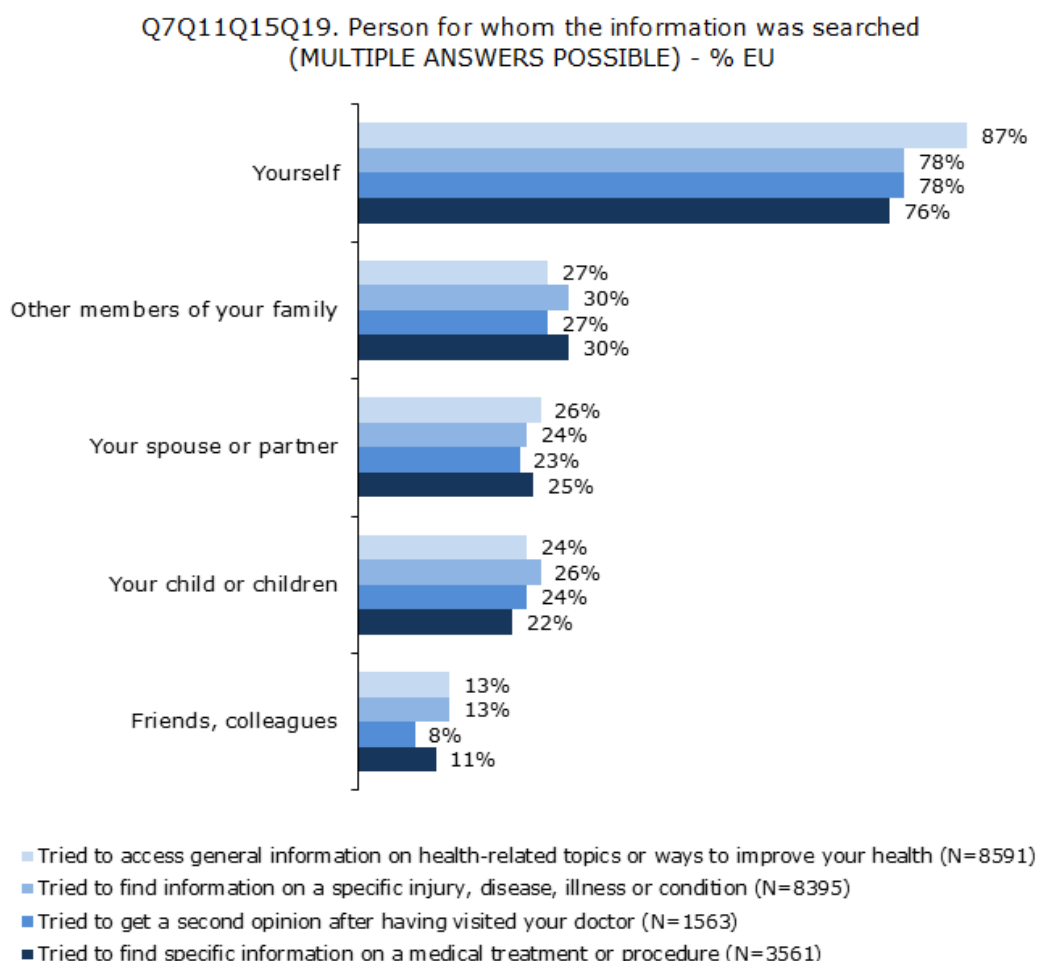

2.4. PERSON FOR WHOM THE INFORMATION WAS SEARCHED

– No matter the type of information respondents search for on the Internet, it is always above all for themselves –

The graph below shows for who the information was searched, depending on the type of health-related information searched for online⁶. Unsurprisingly, respondents most often look for health-related information **for themselves**, whether it is general information (87%), information on a specific injury or condition (78%), a second opinion (78%) or information on a medical treatment or procedure (76%).

When looking at each type of information separately, the graph below shows that similar proportions of respondents look for information on behalf of **other members of their family** (between 27% and 30% depending on the type of information searched for), for **their spouse or partner** (between 23% and 26%) or **for their children** (between 22% and 26%).

Only a minority of respondents look for health-related information **on behalf of a friend or colleague** (between 8% and 13% depending on the type of information searched for).

Base: Respondents that searched the Internet for information on health-related topics (N=8591), on a specific injury, disease or condition (N=8395), to get a second opinion after having visited the doctor (N=1563), on a medical treatment or procedure (N=3561) within the last 12 months.

⁶ Please note that this graph presents proportions calculated on the basis of respondents who have used each type of information.

III. SATISFACTION WITH THE INFORMATION FOUND ON THE INTERNET

As in the previous chapter of the report, the questions in the third chapter were asked only to respondents who said that they had used the Internet to search for health-related information within the past 12 months.

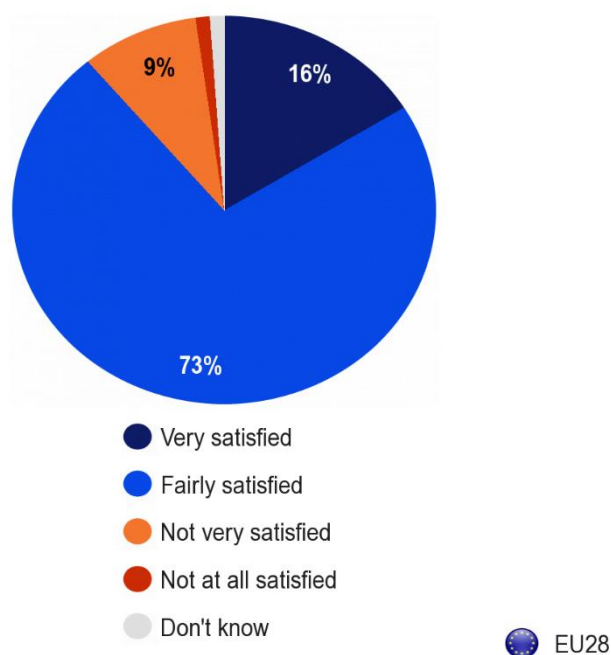

3.1. SATISFACTION WITH THE INFORMATION FOUND ON THE INTERNET

3.1.1. Overall satisfaction with the information found on the Internet

– The level of satisfaction with health-related information found on the Internet is high in all EU countries –

This group of respondents was first asked how satisfied they were with the health-related information they found on the Internet. Nearly nine out of ten people (89%) say they were satisfied with the information they found, with most of them being fairly satisfied (73%) and a limited proportion being very satisfied (16%). Just 10% of people were not satisfied, including only 1% who were not at all satisfied.

Q22. Overall, how satisfied or not are you with the health-related information you found on the Internet?

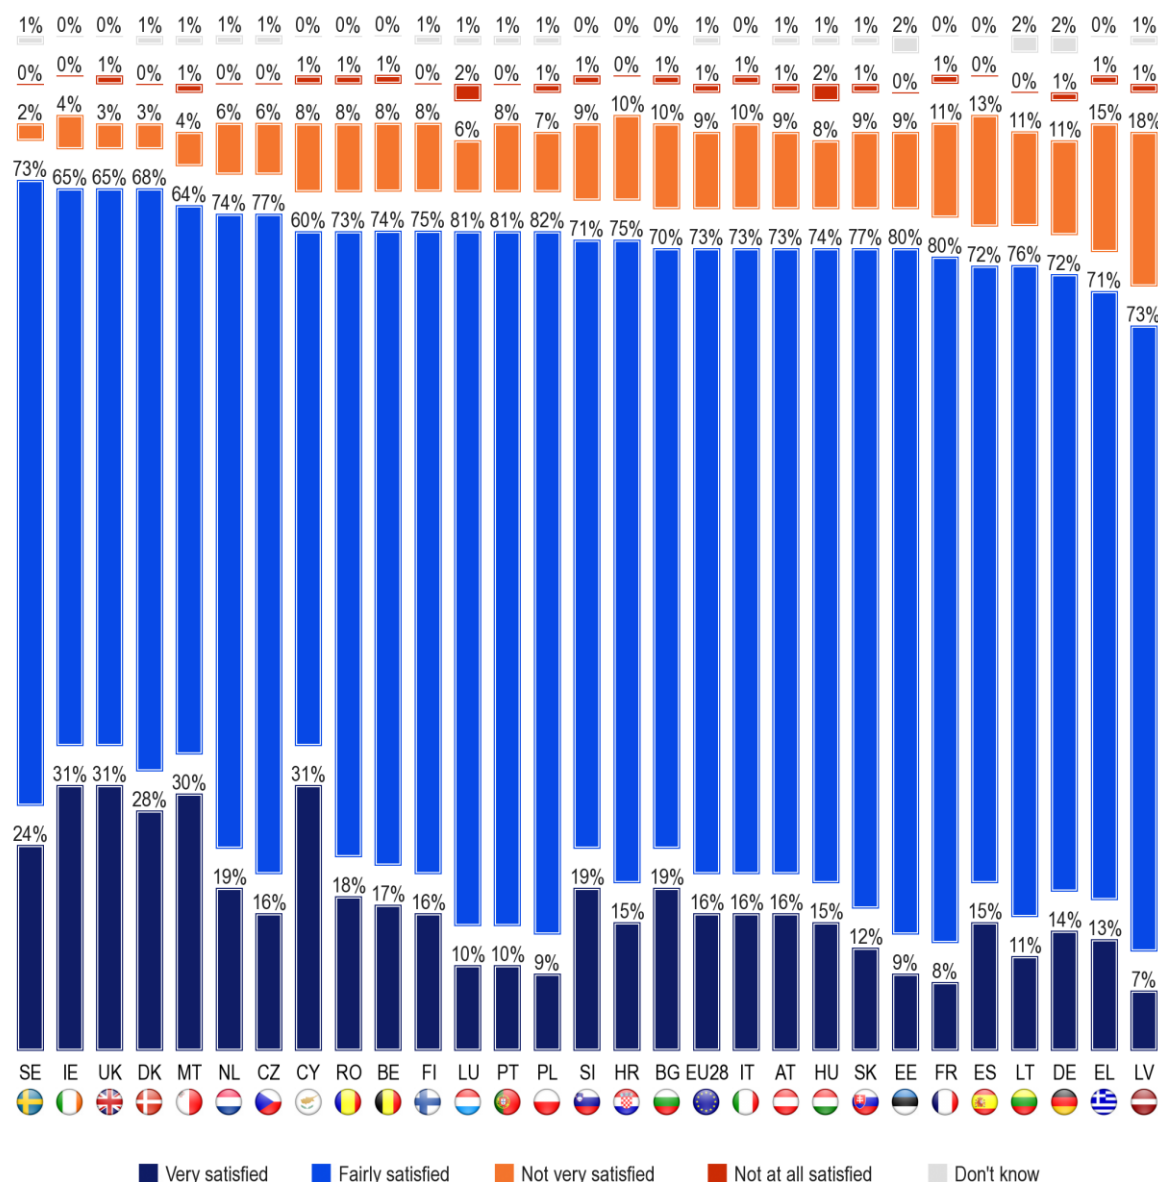

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

At least 90% of people in 16 Member States say that they are satisfied with the health-related information they found on the Internet. Overall satisfaction is highest in Sweden (97%), Ireland (96%) and the UK (96%). Additionally, at least three out of ten people feel very satisfied in Cyprus, Ireland and the UK (all 31%) and in Malta (30%).

Overall levels of dissatisfaction can be noted in Latvia (19%), Greece (16%), Spain (13%) and Germany (12%).

Q22. Overall, how satisfied or not are you with the health-related information you found on the Internet?

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

According to the socio-demographic data:

- No significant differences can be observed when looking at gender, age, level of education or other usual socio-demographic factors.
- While 92% of people who consider they know how to navigate the Internet to find the answers to their health questions were satisfied with the information they found, this proportion drops to 60% for people who consider they don't.
- Almost all respondents (94%) who think that the Internet is a good tool to improve their knowledge of health-related topics were satisfied with the information they found, as opposed to about half (48%) of people who don't agree that the Internet is a good tool.

Q22 Overall, how satisfied or not are you with the health-related information you found on the Internet?

	Very satisfied	Fairly satisfied	Not very satisfied	Not at all satisfied	Don't know	Total 'satisfied'	Total 'not satisfied'
EU28	16%	73%	9%	1%	1%	89%	10%

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

3.1.2. Reasons of dissatisfaction with the information found on the Internet

– Half of the people dissatisfied with the health-related information they found online consider it is not reliable –

People who were not satisfied with the information they found on the Internet were then asked to explain their reasons. They were allowed to give multiple answers from a list of eight options.

Roughly half of the people who were not satisfied consider the information they found was not reliable (50%), was commercially oriented (48%) or was not detailed enough (46%).

Over three out of ten respondents feel dissatisfied because the information was not tailored to their specific needs (39%), because it lacked illustrations or visual elements (33%), because it was difficult to understand (33%) or because they could not find the information they were looking for (32%).

A tenth of people (10%) regret that the information was not available in a language they speak.

Q23. For what reasons are you not satisfied with the health-related information you found on the Internet? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents that are not satisfied with the health-related information they found on the Internet (N=1479)

In eight Member States, a majority of people say that they were not satisfied with the information they found because it was **unreliable**. The proportion of people giving this answer ranges from 12% in Estonia and 17% in Malta up to 61% in both Belgium and the UK and 75% in Luxembourg.

Feeling that the information was **commercially oriented** was the most common reason given in 12 countries, with the highest proportion observed in the Czech Republic (74%), followed by the UK (71%). Relatively fewer people give this answer in Cyprus (11%) and Estonia (12%).

In five countries, a majority of people were not satisfied because the information they found was **not detailed enough**. More than seven out of ten people mention this reason in Belgium (73%), Poland (73%) and Latvia (71%), while relatively few do so in Malta (10%) and Slovenia (20%).

In Sweden (61%) and Denmark (56%), a majority of respondents say they were not satisfied because they did not find information **tailored to their specific needs**. Relatively high proportions of people also give this explanation in Belgium (68%) and the Czech Republic (64%). Malta (8%) again has an exceptionally low proportion of people who mention this reason.

A majority of people in Portugal (53%) and Cyprus (45%) say that they were dissatisfied with the information they found because it was **hard to understand**.

Respondents in Sweden (56%), the UK (54%) and Belgium (50%) are more likely to say that the information they found **lacked illustrations or visuals**, while Belgium (58%) again stands out as having the highest proportion who say they **could not find what they were looking for**.

In five countries, at least a fifth of people say that the information they found was **not in a language that they could speak**: the Czech Republic (32%), Bulgaria (24%), Latvia (24%), Poland (24%), and Finland (24%).

Q23 For what reasons are you not satisfied with the health-related information you found on the Internet? (MULTIPLE ANSWERS POSSIBLE)

	The information was not reliable	You had the feeling the information was commercially oriented, encouraging you to buy something	The information was not detailed enough	You did not find information tailored to your specific needs	The information you found lacked illustrations, visual information	The information was difficult to understand / not clear enough	You did not manage to find what you were looking for	The information was not available in a language you speak	Other (DO NOT READ OUT)	Don't know

Base: Respondents that are not satisfied with the health-related information they found on the Internet (N=1479)

The socio-demographic data show that:

- Among respondents that are not satisfied with the health-related information they found on the Internet, younger respondents are more likely than older ones to say they were not satisfied because of a lack of visuals, because the information was too commercial, or because it was unreliable.
- Individuals who left education aged 15 or under are much more likely than those who left aged 20 or over to say that they were unsatisfied because of a lack of visual information (53% vs. 29%). Conversely, people with a higher level of education are more likely to say they were dissatisfied because the information they found was too commercial (52% vs. 39%).
- People who consider they do not know how to navigate the Internet to find the answers to their health questions are more likely to say they were not satisfied because the information they found was difficult to understand (51% vs. 28%).
- Individuals who say they have good knowledge of health-related topics are more likely to say that the information they found was not detailed enough (50% vs. 37%).

Q23 For what reasons are you not satisfied with the health-related information you found on the Internet? (MULTIPLE ANSWERS POSSIBLE)

	The information was not reliable	You had the feeling the information was commercially oriented, encouraging you to buy something	The information was not detailed enough	You did not find information tailored to your specific needs	The information you found lacked illustrations, visual information	The information was difficult to understand/ not clear enough	You did not manage to find what you were looking for	The information was not available in a language you speak	Other (DO NOT READ OUT)	Don't know

Base: Respondents that are not satisfied with the health-related information they found on the Internet (N=1479)

3.1.3. Quality of the information found on the Internet

– Respondents are generally very positive about the health-related information they found on the Internet –

All respondents who used the Internet to look for health-related information were asked about the quality of the information they found. They were asked to react to a series of seven satisfaction elements.

Eight out of ten people (80%) think that the information they found was useful, while roughly three-quarters say that it was easy to understand (77%) and easy to find (74%).

Around two-thirds of respondents consider that the information they found was relevant to their personal situation (67%) and had an appropriate level of detail (66%). Six out of ten people say that it came from a trustworthy source (60%) and that it was thorough (59%).

Q20. Let's talk about the quality of the information you found on the Internet... (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

Respondents in the UK consistently express a very high level of satisfaction with the information they found, while those in Slovakia and Slovenia express a consistently low level of satisfaction.

At least seven out of ten people in 24 Member States say that the information they found was **useful**, with very high proportions of people taking this view in the UK (94%) and Portugal (92%). The four exceptions where relatively fewer people say that the information they found was useful can be noted in Slovenia (53%), Slovakia (55%), Lithuania (58%) and Italy (62%).

At least six out of ten people in all except five Member States say that the information they found on the Internet was **easy to understand**. Again the highest proportion of people who say this can be observed in the UK (94%), followed by Spain (91%). Less than six out of ten people take this view in Slovakia (44%), Slovenia (48%), Cyprus (56%), Lithuania (57%) and Estonia (58%).

Similarly, at least six out of ten people in all except five Member States say that the information they found was **easy to find**, with higher proportions of people taking this view in the UK (93%), Spain (91%) and Belgium (87%). The five exceptions where relatively fewer people say that the information they found was easy to find can be noted in Slovakia (33%), Slovenia (35%), Lithuania (54%), Poland (55%) and Cyprus (58%).

At least half of respondents in 16 Member States say that the information they found on the Internet **came from a trustworthy source**. The highest proportions of respondents who mention this can be observed in the UK (89%), Finland (76%) and Sweden (75%). Conversely, less than one quarter of respondents share this view in Slovakia (18%) and Slovenia (24%).

The pattern is similar for the other measures of satisfaction. Relatively high numbers of people express satisfaction in the UK, Spain, Belgium, Austria and Finland, while relatively few do so in Slovakia, Slovenia, Lithuania, and Cyprus.

Q20 Let's talk about the quality of the information you found on the Internet... (MULTIPLE ANSWERS POSSIBLE)

		It was useful	It was easy to understand	It was easy to find	It was relevant to your personal situation	It had an appropriate level of detail (enough/not too much)	It came from a trustworthy source	It was thorough	Other (DO NOT READ OUT)	None of the above (DO NOT READ OUT)	Don't know	Average number of answers given

Lowest percentage per item

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

According to the socio-demographic data:

- Women are somewhat more likely than men to give six or seven positive answers (54% vs. 49%).
- People who are not working are the most likely to give six or seven positive answers (51%), while self-employed people are the least likely to do so (43%).
- Most people (53%) who consider they know how to navigate the Internet to find the answers to their health-related questions, give six or seven positive answers, vs. 27% of people who consider they don't.
- 61% of people who trust the information from the Internet to make health-related decisions give six or seven positive answers, vs. 37% of those who do not.
- Most people (54%) who believe the Internet is a good tool to improve their knowledge of health-related topics give six or seven positive answers, compared to roughly a quarter (24%) of those who do not regard it as a good tool.
- People with good knowledge of health-related topics (55%) are more likely to give six or seven positive answers than those with poor knowledge of these issues (36%).

Q20B Let's talk about the quality of the information you found on the Internet... (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

3.2. CITIZENS' UNDERSTANDING OF ONLINE HEALTH-RELATED INFORMATION

– Views of health-related information found on the Internet are generally positive –

Respondents were then given nine statements and asked whether they agree or disagree with them.

A very substantial proportion of people (94%) agree that they **know how to navigate the Internet to find answers to health-related questions**, out of which 51% totally agree and the rest tend to agree. Only 6% do not agree.

More than nine out of ten respondents (92%) agree that **their research on the Internet helps them improve their knowledge of health-related topics**. Of these, 42% totally agree, and 50% tend to agree. Just 7% of respondents do not agree.

Nine out of ten people (90%) agree that they **know how to use the health-related information they find on the Internet**, with 36% totally agreeing and 54% tending to agree. Nearly a tenth (9%) do not agree.

More than eight out of ten respondents (83%) agree that **there is sufficient information on health-related topics available on the Internet**, with 37% totally agreeing, and 46% tending to agree. 15% of respondents do not agree with this.

A similar proportion (83%) also agree that they **know where to find reliable health-related information on the Internet**, with 32% totally agreeing, and 51% tending to agree. 16% do not agree with this.

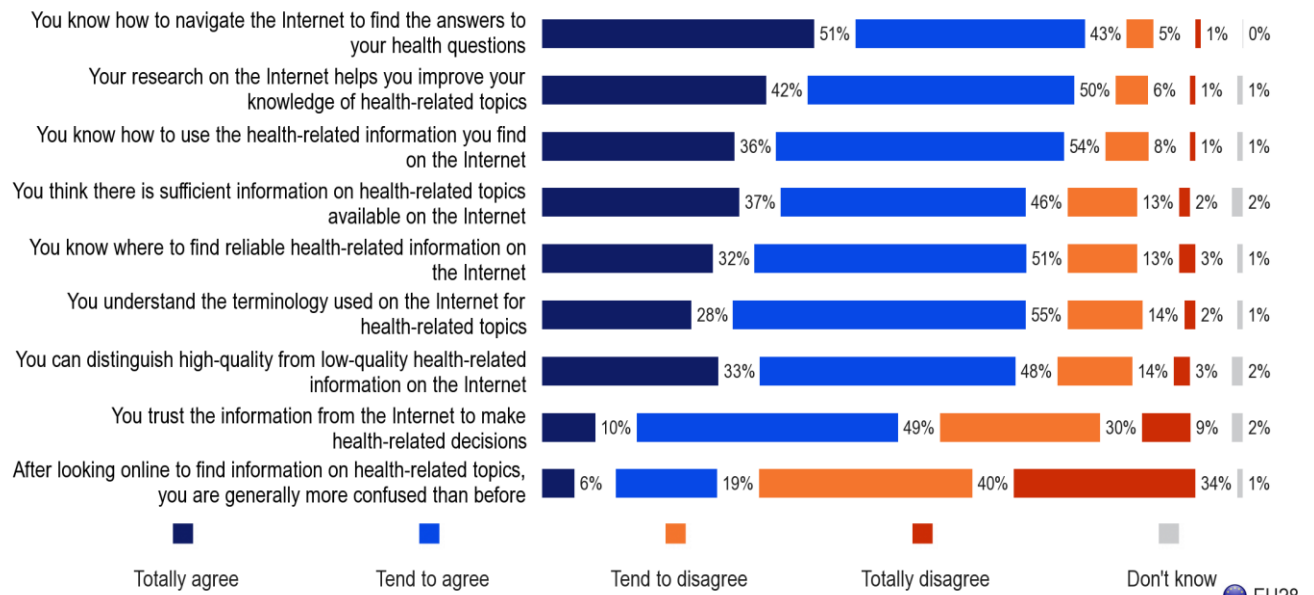

The same proportion of respondents (83%) agree that **they understand the terminology used on the Internet for health-related topics**: 28% totally agree and 55% tend to agree. Again, 16% disagree.

Roughly eight out of ten people (81%) agree that **they can distinguish high-quality information from low-quality health-related information on the Internet**, with 33% totally agreeing, and 48% tending to agree. 17% of people do not agree.

However, a lower proportion of respondents (59%) agree that **they trust information from the Internet to make health-related decisions**, and of these, only 10% totally agree, with 49% tending to agree. Almost four out of ten (39%) people do not agree, of whom 30% tend to disagree and 9% totally disagree.

Only a quarter of respondents (25%) agree that **after looking online for health-related information, they generally feel more confused than before**, with 6% totally agreeing and 19% tending to agree. 74% of people disagree with this statement, with 40% tending to disagree and 34% totally disagreeing.

Q21. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

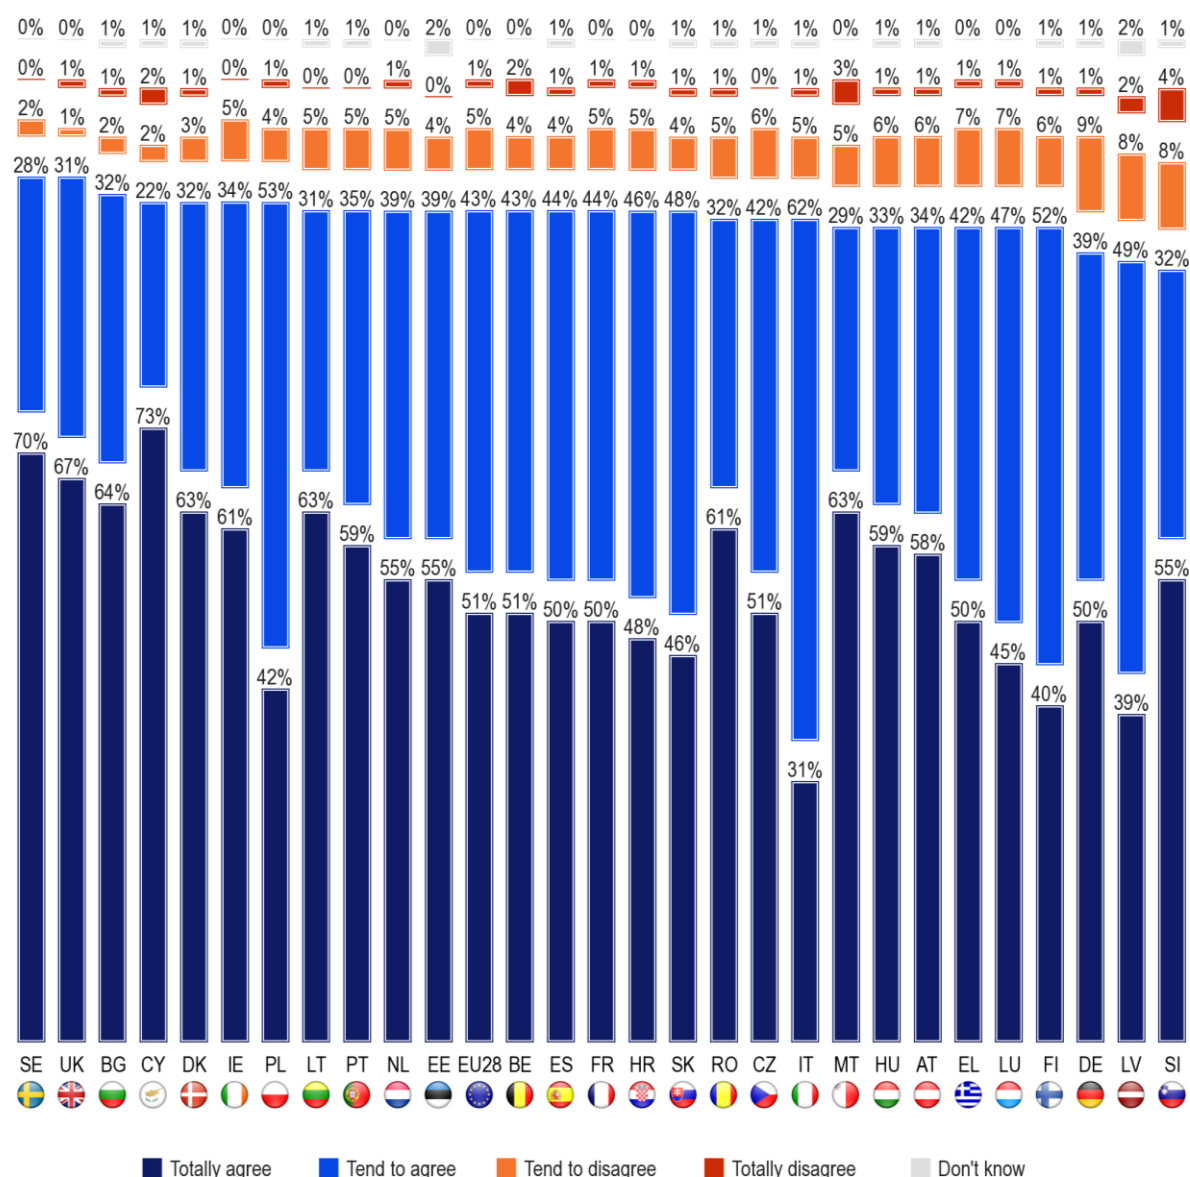

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

In all but three Member States, more than nine out of ten respondents agree that **they know how to navigate the Internet to find answers to their health-related questions**, with the highest proportions in Sweden and the UK (both 98%). The highest proportion of respondents who 'totally agree' with this statement can be observed in Cyprus (73%) and Sweden (70%). The three exceptions, where overall agreement falls below 90%, still have noticeably high levels of agreement: Slovenia (87%), Latvia (88%) and Germany (89%).

Q21.1. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You know how to navigate the Internet to find the answers to your health questions

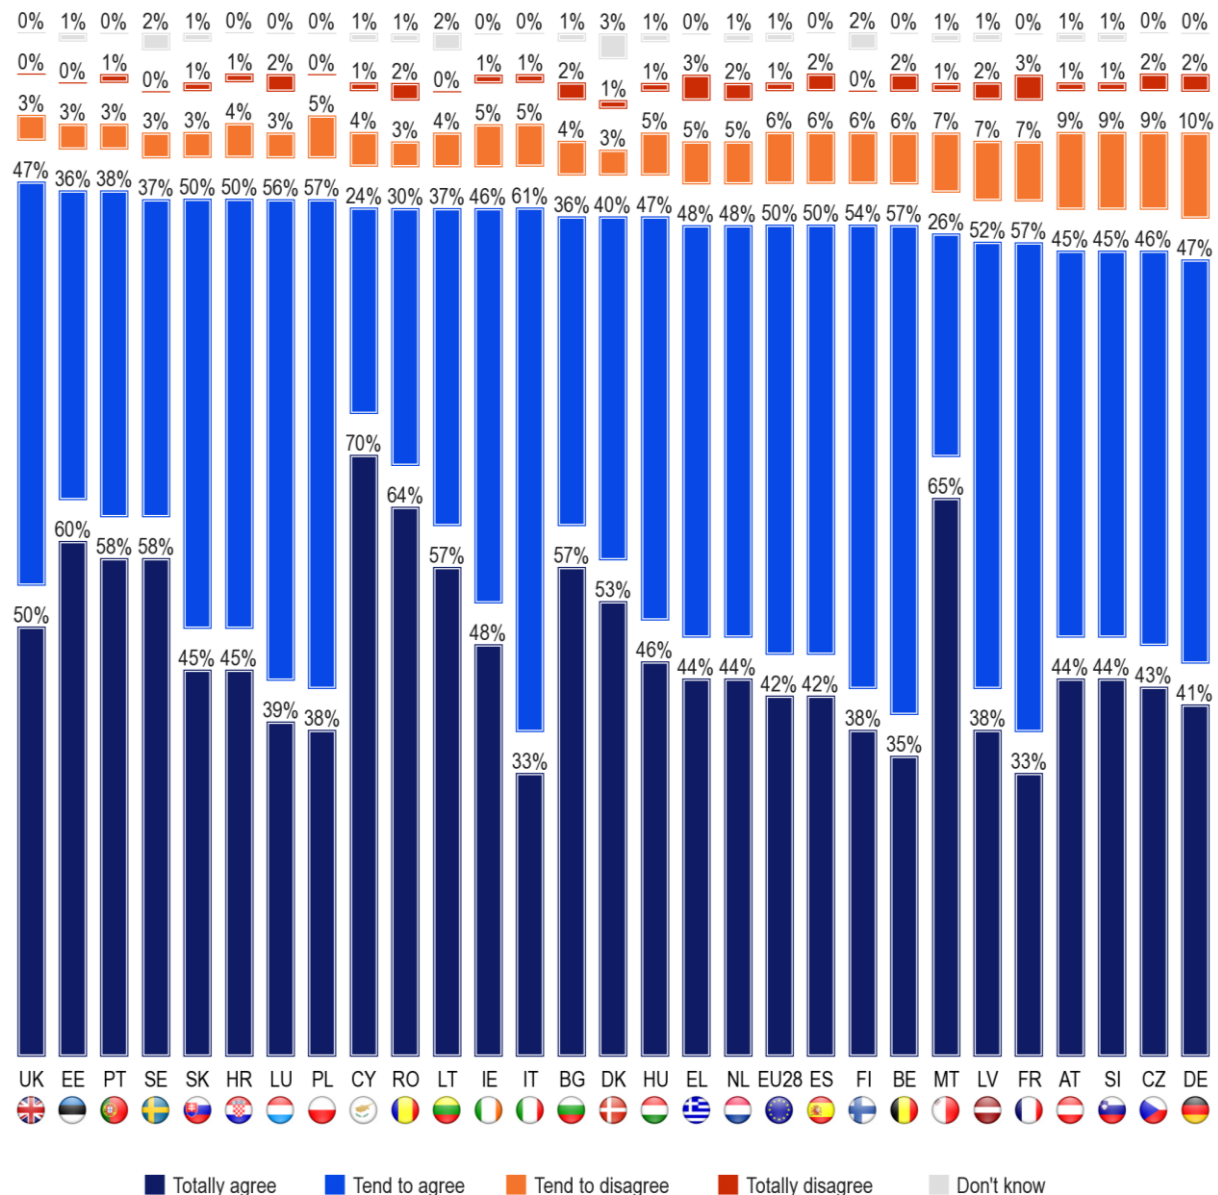

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

At least nine out of ten respondents in all but four EU countries agree that **their research on the Internet helps them to improve their knowledge of health-related topics**. Respondents in the UK (97%), Estonia (96%) and Portugal (96%) express the highest levels of overall agreement. The highest proportions of respondents who 'totally agree' can be found in Cyprus (70%) and Malta (65%). Agreement dips just below 90% only in Germany (88%), Austria, the Czech Republic and Slovenia (all 89%).

Q21.8. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

Your research on the Internet helps you improve your knowledge of health-related topics

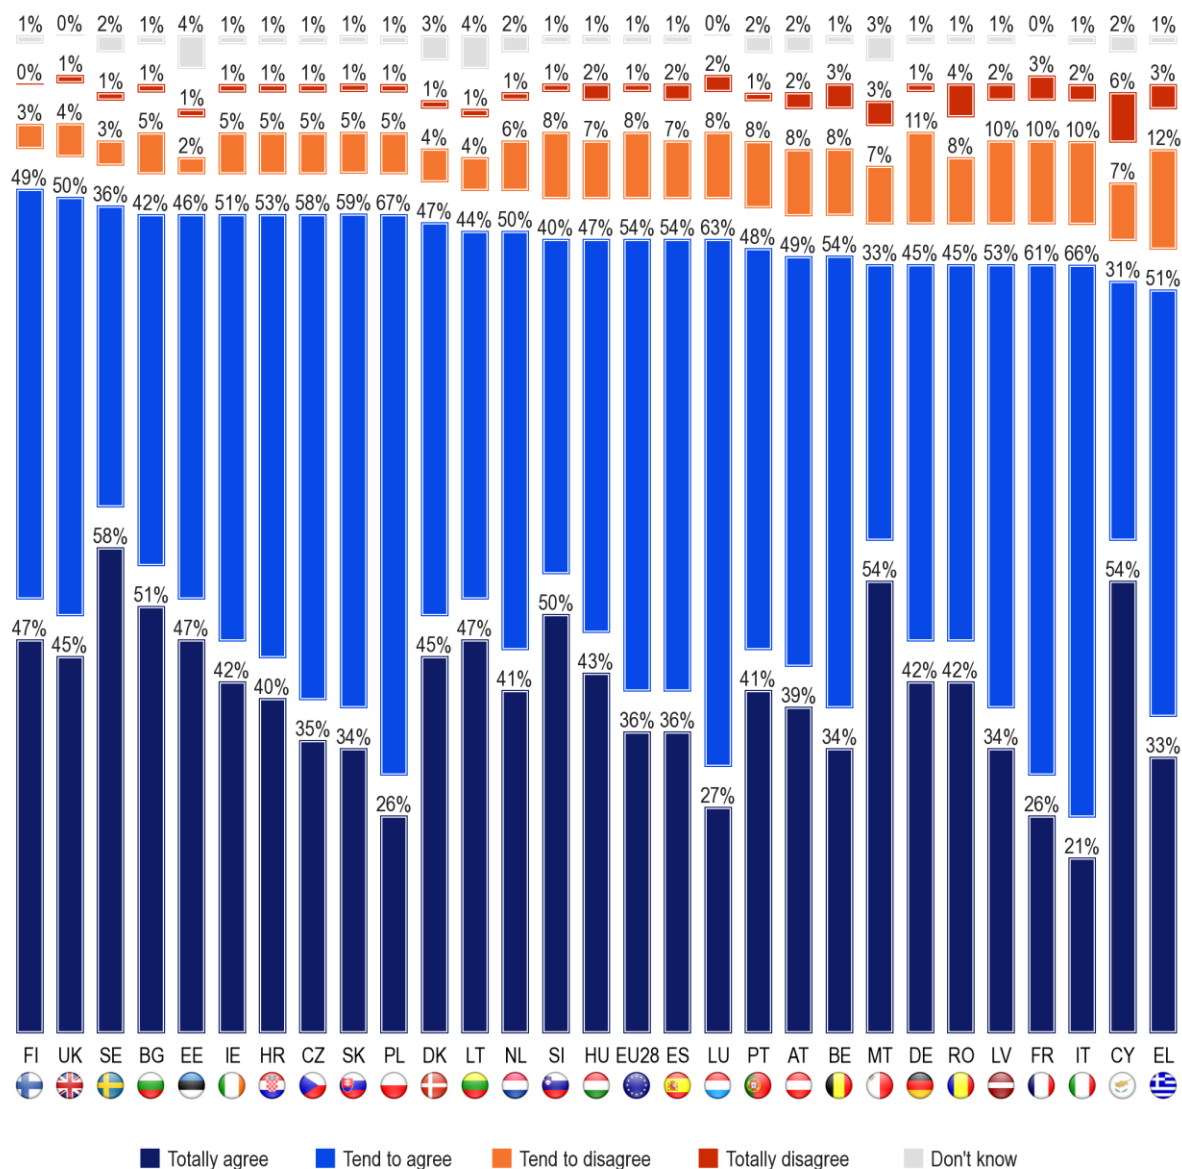

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

At least nine out of ten people in 17 countries agree that **they know how to use the health-related information they find on the Internet**. Respondents in Finland (96%) and the UK (95%) express the highest levels of overall agreement. The highest proportion of respondents who 'totally agree' with this statement can be observed in Sweden (58%). Conversely, overall agreement is lowest in Greece (84%) and Cyprus (85%).

Q21.6. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You know how to use the health-related information you find on the Internet

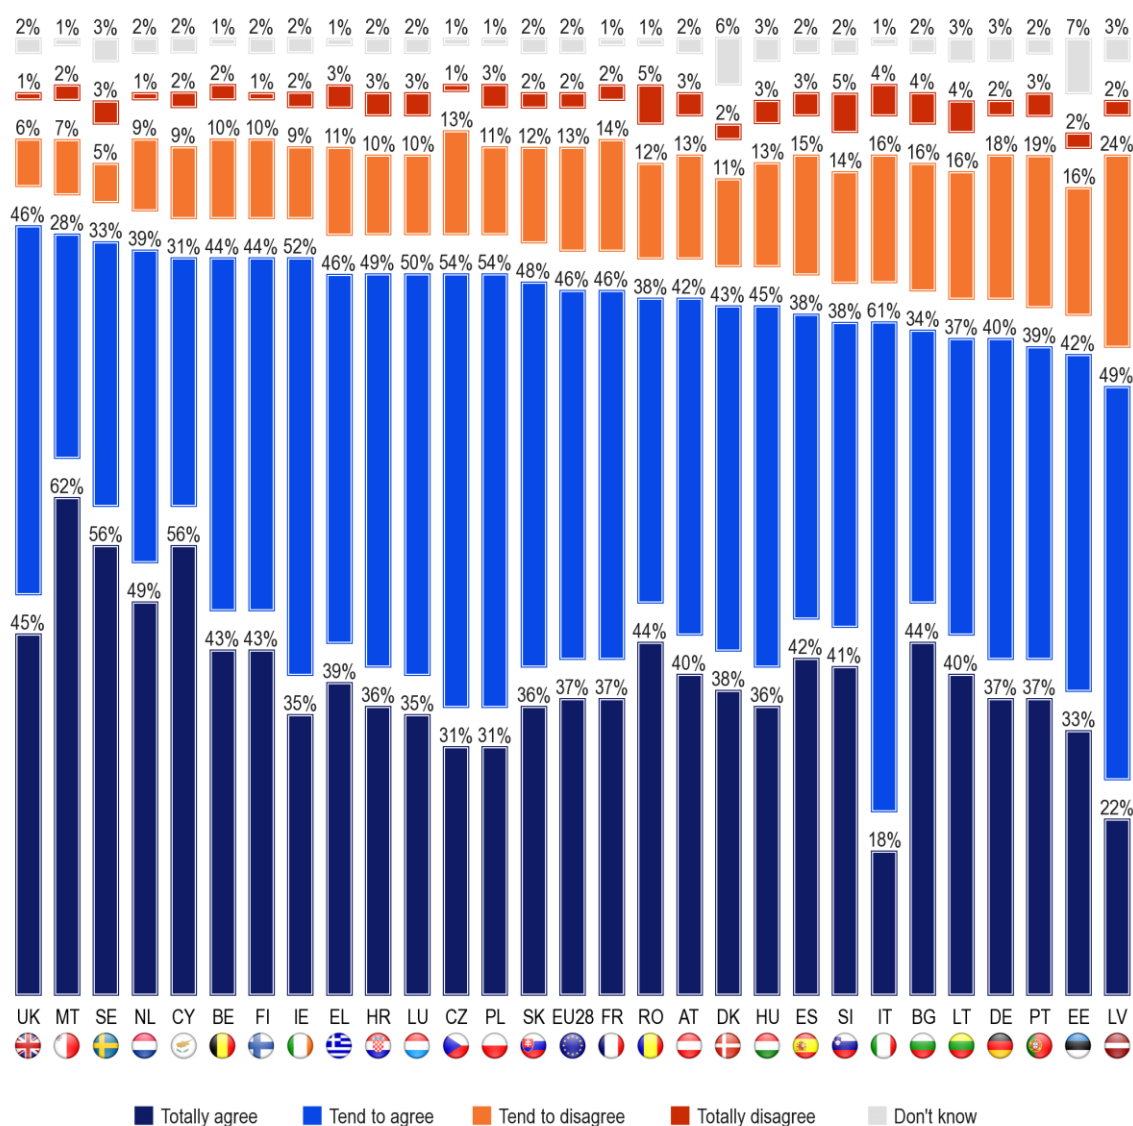

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

In 20 countries, at least eight out of ten respondents agree that **there is sufficient information on health-related topics available on the Internet**. The UK (91%) and Malta (90%) have the highest levels of overall agreement. The highest proportion of respondents who 'totally agree' can be found in Malta (62%) and Cyprus (56%). A relatively lower proportion of people agree that there is sufficient information on health-related topics available on the Internet in Latvia (71%) and Estonia (75%).

Q21.2. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You think there is sufficient information on health-related topics available on the Internet

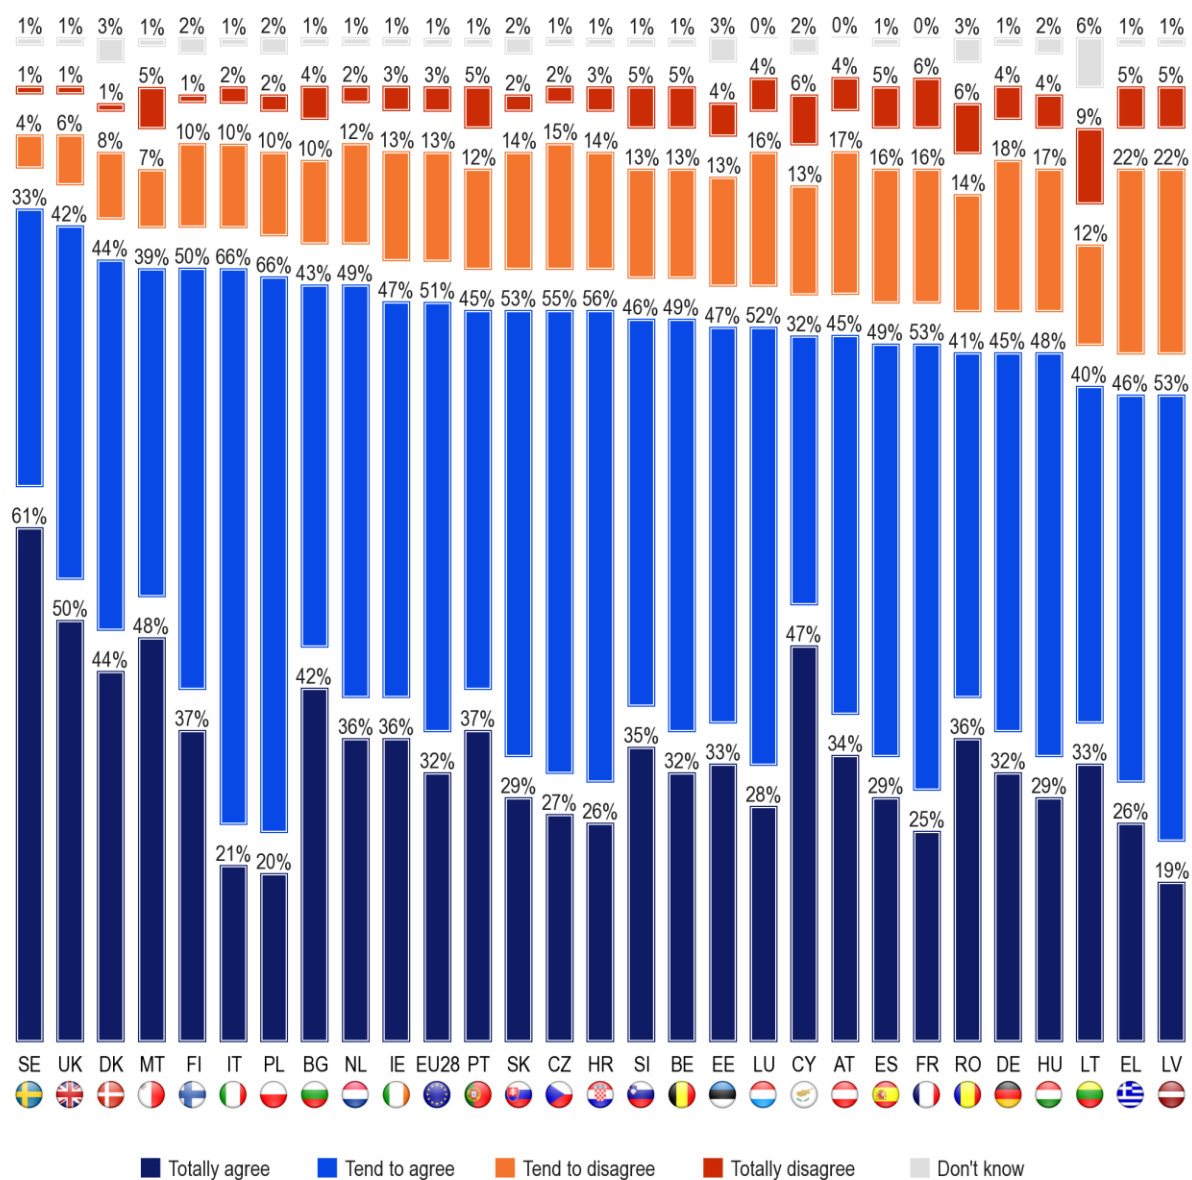

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

At least eight out of ten people in 18 countries agree that **they know where to find reliable health-related information on the Internet**. The highest overall agreement (94%) and 'total agreement' (61%) levels can be observed in Sweden, followed by the UK (92%, and 50% respectively). A relatively lower proportion of people agree that they know where to find reliable health-related information on the Internet in Latvia and Greece (both 72%).

Q21.3. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You know where to find reliable health-related information on the Internet

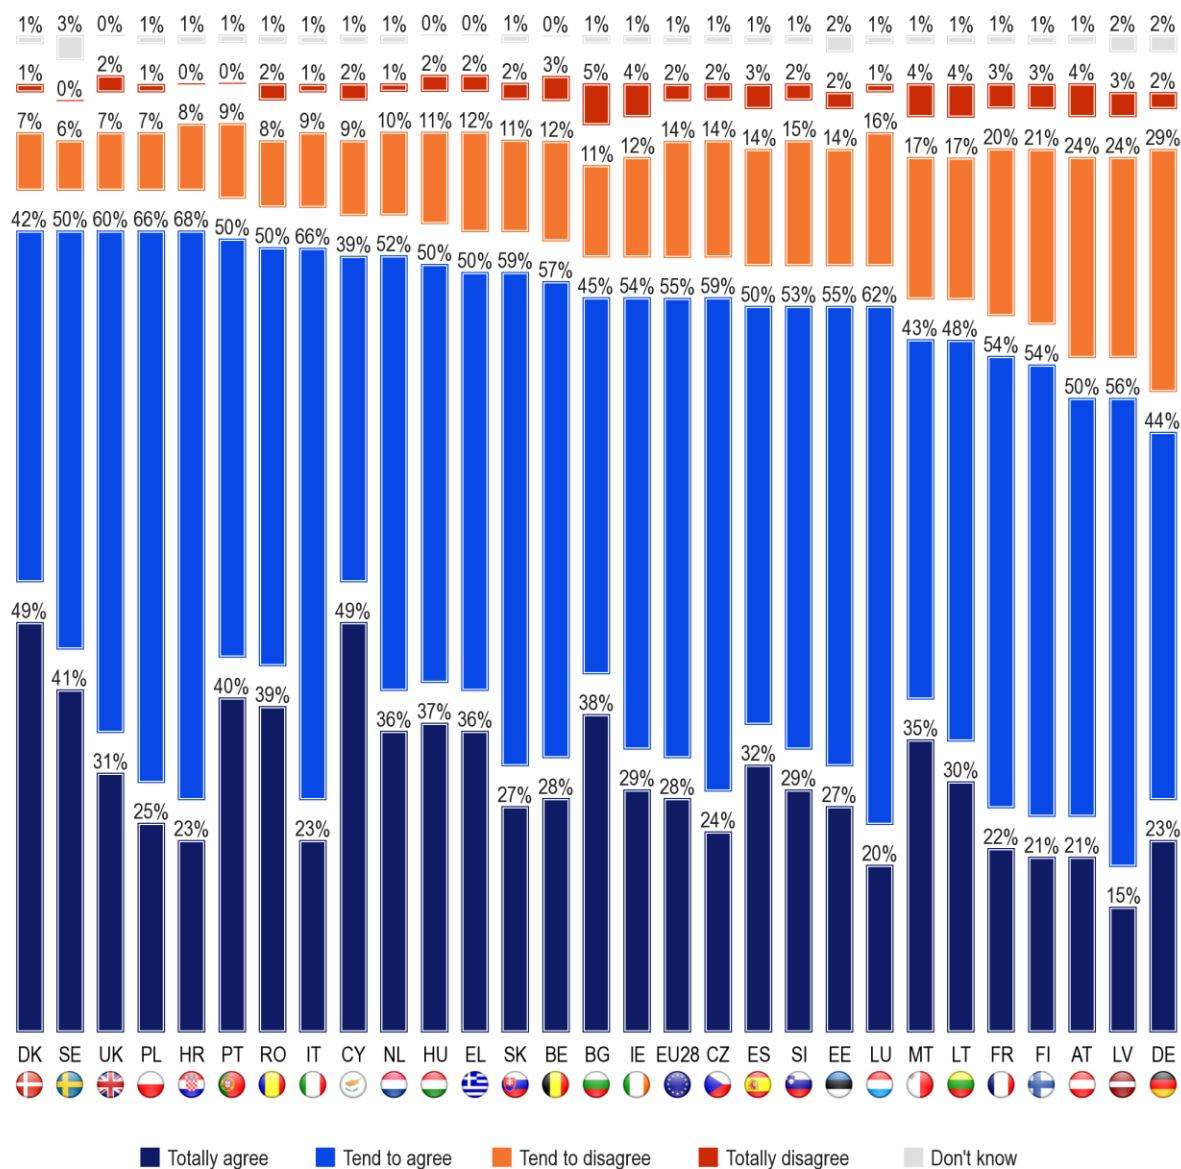

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

In 21 Member States, more than 80% of people agree that **they understand the terminology used on the Internet for health-related topics**. More specifically, 91% of people agree with this in Denmark, Sweden, the UK, Poland and Croatia. The percentage of people who 'totally agree' is highest in Denmark and Cyprus (both 49%). In Germany, only 67% of people agree with this statement, as do 71% in Latvia and in Austria.

Q21.4. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You understand the terminology used on the Internet for health-related topics

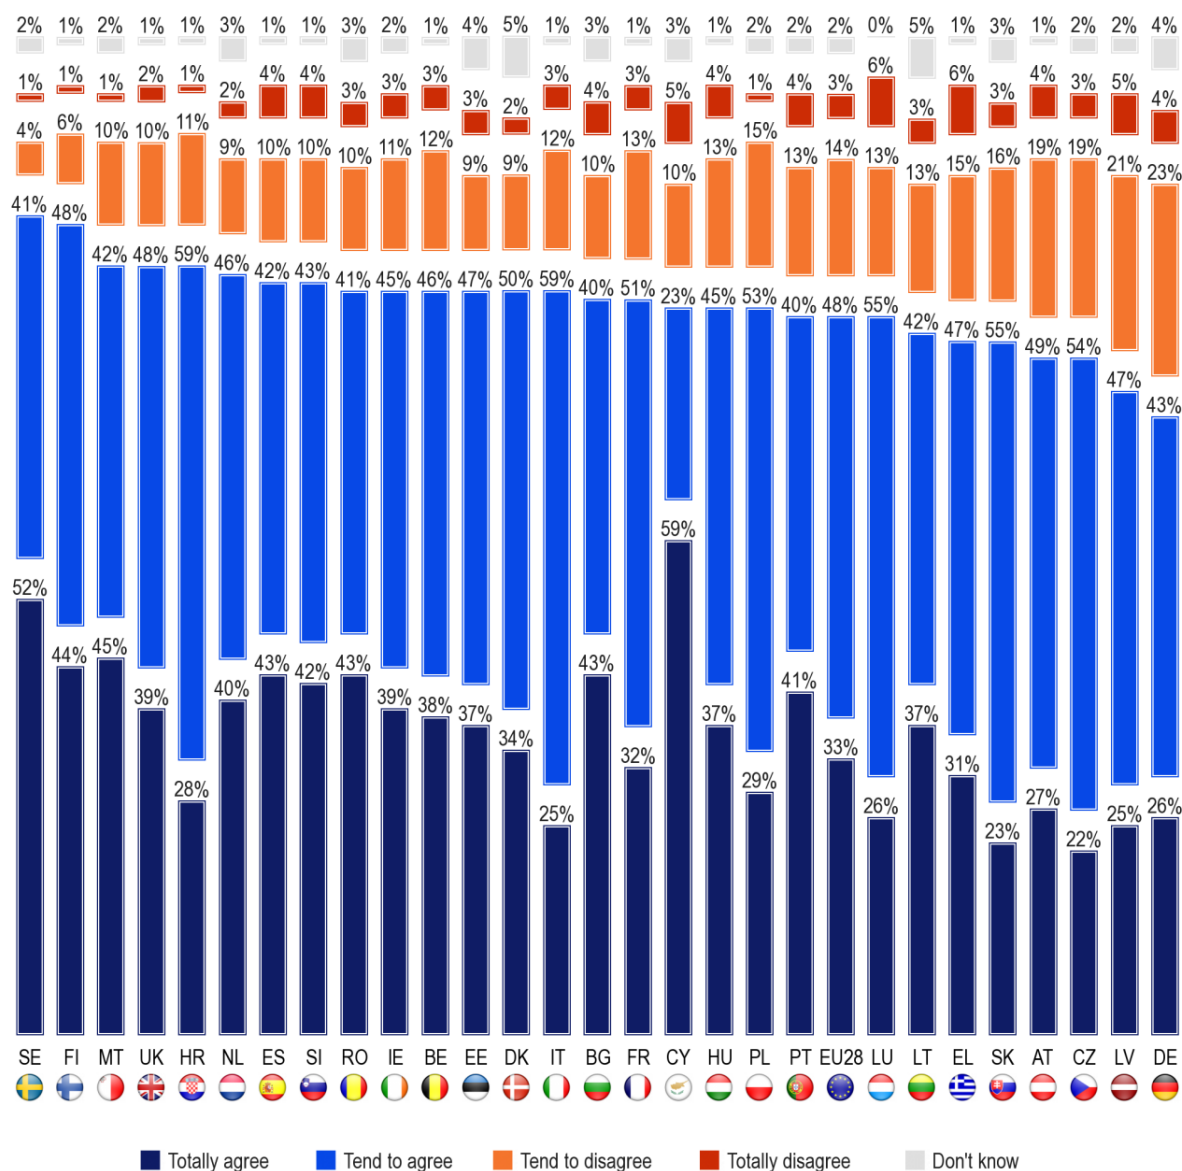

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

Also in 21 Member States, more than eight out of ten people agree that **they can distinguish high-quality from low-quality health-related information on the Internet**. Overall agreement is highest in Sweden (93%) and Finland (92%), while the percentage of people who 'totally agree' is highest in Cyprus (59%). Conversely, the lowest proportions of people who are in agreement can again be observed in Germany (69%) and Latvia (72%).

Q21.5. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You can distinguish high-quality from low-quality health-related information on the Internet

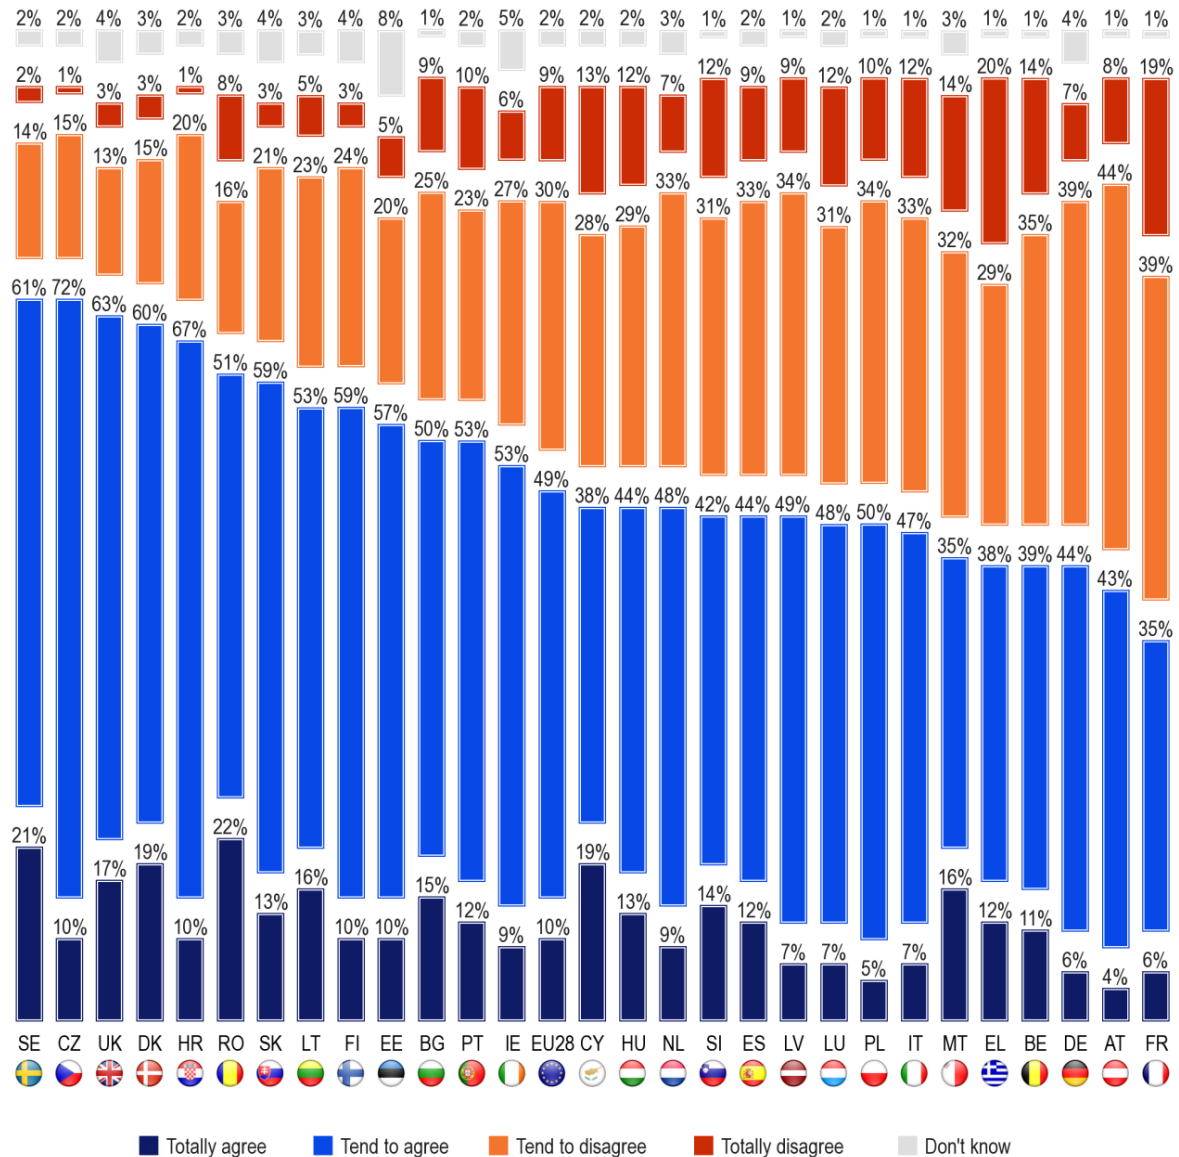

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

In 13 Member States, at least 60% of people agree that **they can trust information from the Internet to make health-related decisions**. Overall agreement on this point is highest in Sweden and the Czech Republic (both 82%). However, the percentage of respondents who say that they 'totally agree' is noticeably low across the EU relatively to the previous questions, never climbing higher than 22% (in Romania). More people disagree than agree in two countries: France (58% disagree vs. 41% agree) and Austria (52% vs. 47%).

Q21.7. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

You trust the information from the Internet to make health-related decisions

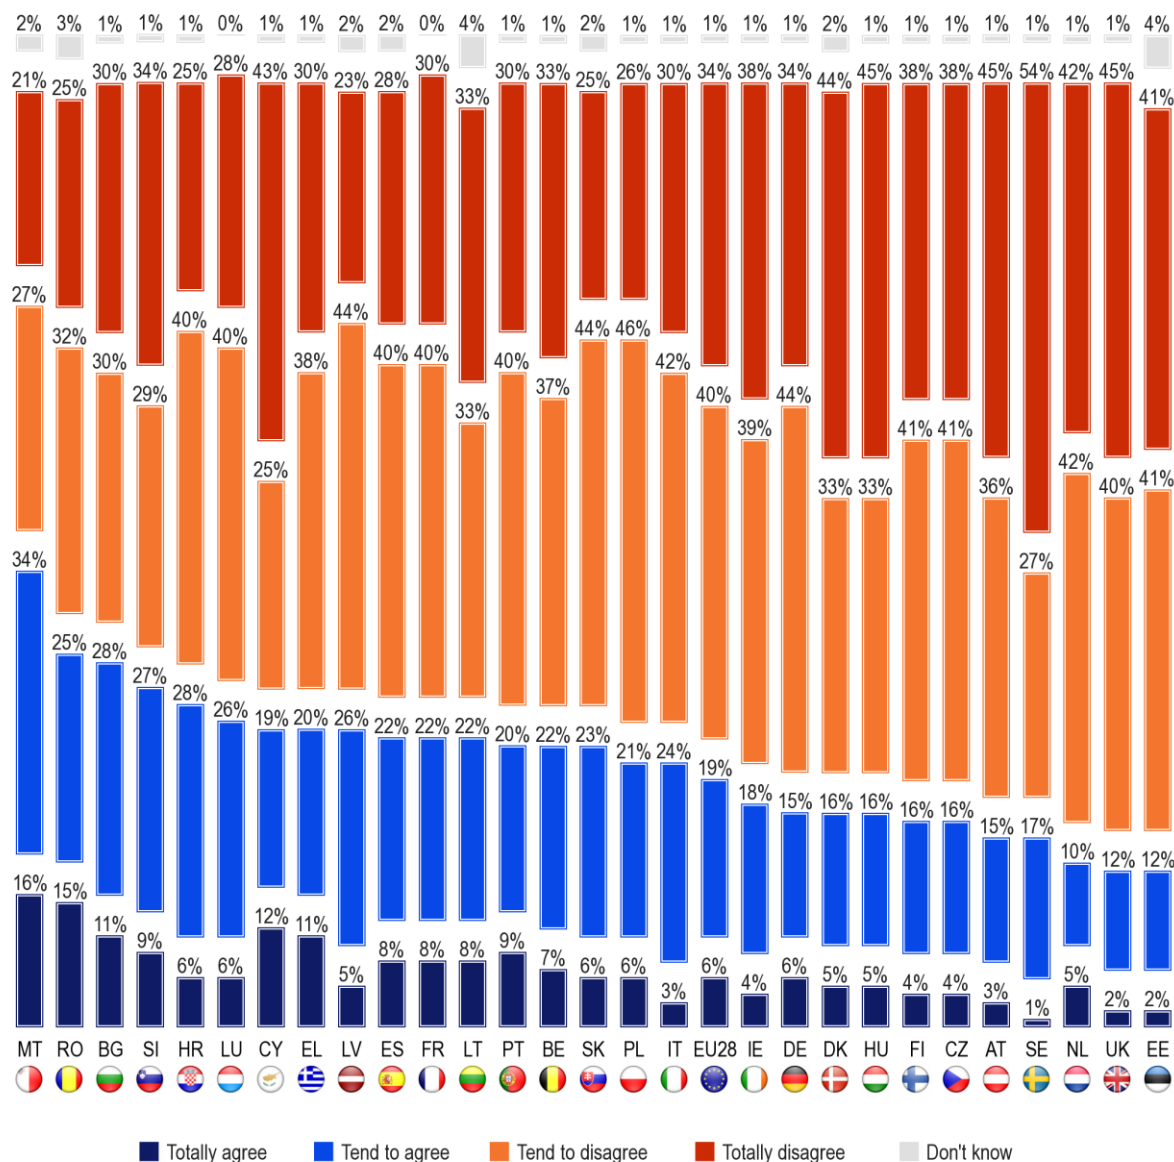

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

Malta is the only country where more people agree (50%) than disagree (48%) that **after looking online for health-related information, they generally feel more confused than before**. Overall agreement is also relatively higher in Romania (40%) and Bulgaria (39%). Elsewhere, relatively high proportions of people disagree, such as in the UK (85%) and the Netherlands (84%).

Q21.9. For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

After looking online to find information on health-related topics, you are generally more confused than before

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

The socio-demographic data show that:

- Respondents who agree with a certain statement in this section are generally more likely to agree with other statements.
- People aged 40 and over (61-62%) are somewhat more likely than those aged 39 and below (55-57%) to say that they trust the information from the Internet to make health-related decisions.
- 62% of people who have good knowledge of health-related topics say that they trust the information from the Internet to make health-related decisions, compared with 43% of people who consider they have poor knowledge.
- Respondents with a higher level of education (who left education at 20 years old or more) are more likely to understand the terminology used on the Internet for health-related topics (86% vs 78%-81%) and to be able to distinguish high-quality from low-quality health-related information on the Internet (84% vs 75%-79%).

Q21 For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

Total 'Agree'

	You know how to navigate the Internet to find the answers to your health questions	Your research on the Internet helps you improve your knowledge of health-related topics	You know how to use the health-related information you find on the Internet	You think there is sufficient information on health-related topics available on the Internet	You know where to find reliable health-related information on the Internet

3.3. LIKELINESS TO USE THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION IN THE FUTURE

– Most respondents say they would be likely to use the Internet again in the future to look for health information –

People who have already used the Internet to search for health-related information are highly likely to say that they would do so again: indeed, 92% of respondents say they would use the Internet next time they want to get health-related information, with 55% of these highly likely to do so. Just 8% of respondents say they are not likely to use the Internet again for this purpose.

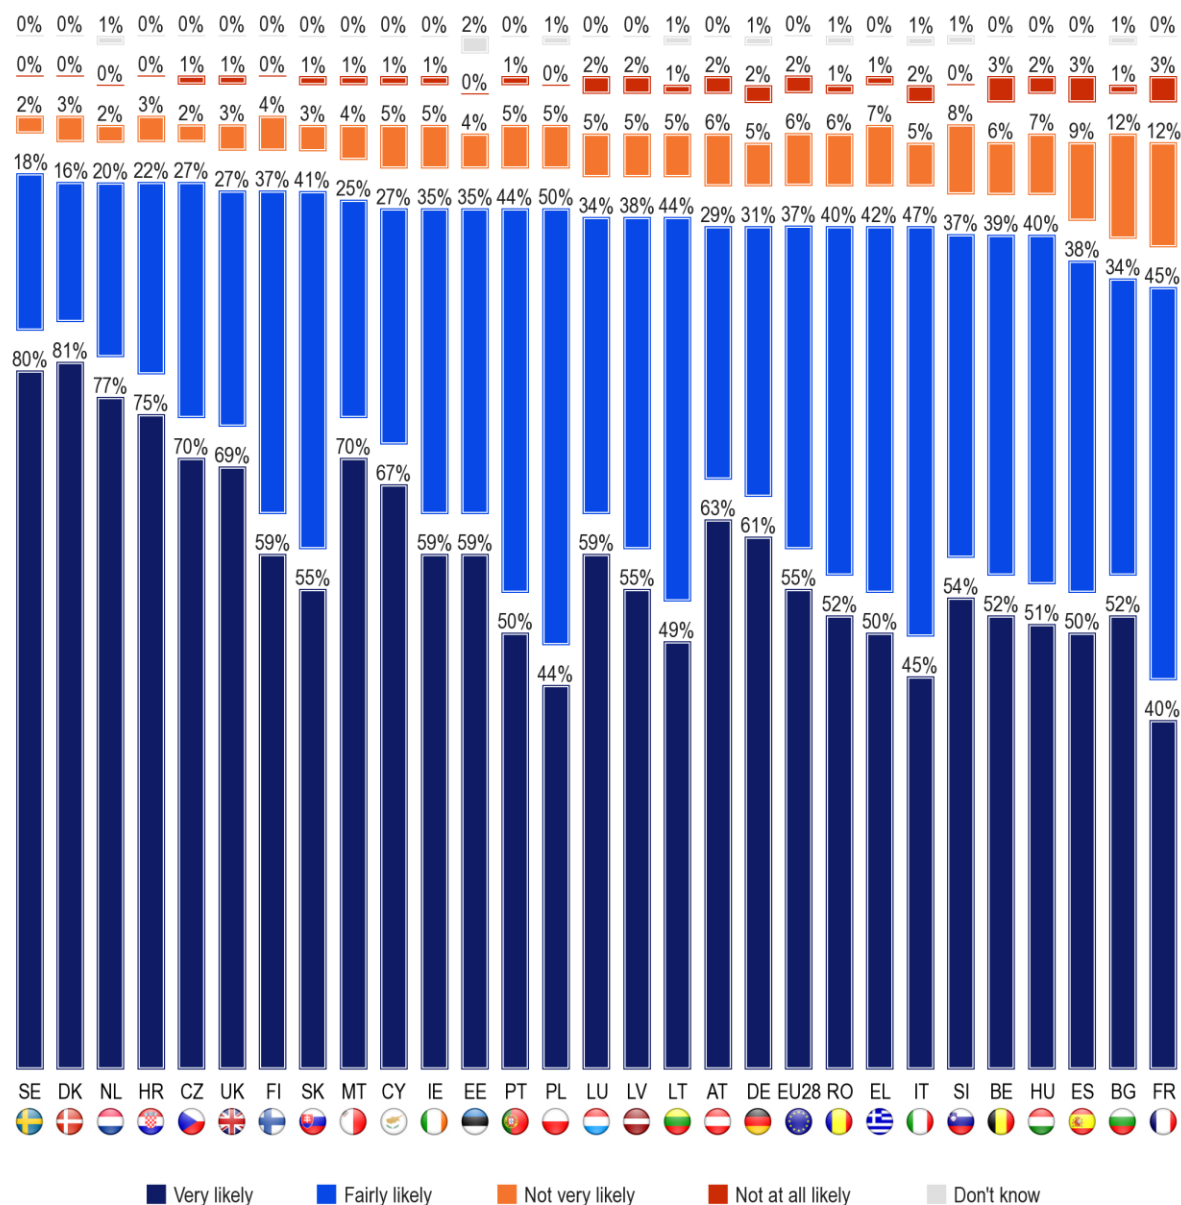

Q25. Next time you want to get information on health-related questions, how likely are you to use the Internet?

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

At least nine out of ten people in all but three Member States say that they are likely to use the Internet the next time they want information on health-related questions. People in Sweden (98%), Denmark, the Netherlands, Croatia and the Czech Republic (all 97%) are highly likely to say this. The three countries where fewer than 90% of people say they are likely to use the Internet again for health-related research are France (85%), Bulgaria (86%) and Spain (88%).

Q25. Next time you want to get information on health-related questions, how likely are you to use the Internet?

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

The socio-demographic data show that:

- Respondents who say they know how to navigate the Internet to find health-related information are more likely to say that they would probably use the Internet next time they need to get health-related information (94% vs. 73%). The same applies to people who say they know how to use the information they find on the Internet (94% vs. 73%).
- People who think that the information they find on the Internet helps them improve their knowledge of health-related topics are more likely to say they would use the Internet next time (95% vs. 64%).
- Most people who think the Internet is a good tool to help improve their knowledge of health-related topics (95%) say that they are likely to use the Internet next time, vs. 57% of those who do not think so.

3.4. NEXT STEPS AFTER USING THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION IN THE FUTURE

– After searching online for health-related information, respondents most commonly spoke to friends or relatives, or made a doctor's appointment –

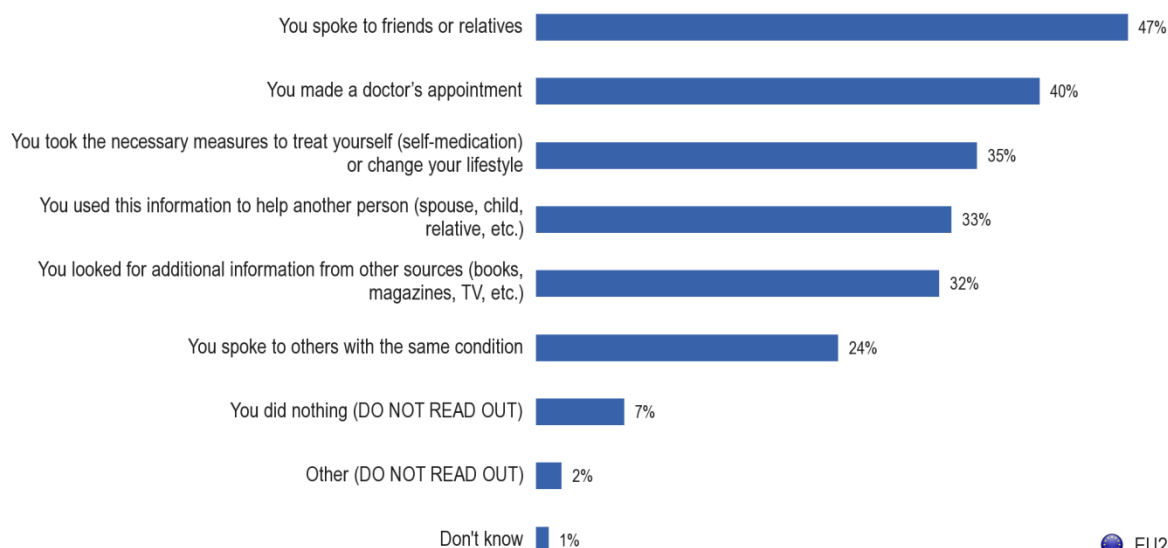

Respondents were asked to think back to the last time they used the Internet to search for health-related information and to say what they did next. They were allowed to give multiple answers from a list of six options.

Nearly half of the respondents (47%) say that they spoke to friends or relatives, while four out of ten (40%) made a doctor's appointment.

Roughly a third of respondents took the necessary measures to treat themselves (35%), used the information to help another person (33%), or looked for additional information from other sources (32%).

Just under a quarter of people say they spoke to others with the same condition (24%), while 7% of respondents say spontaneously that they did nothing.

Q24. Think back to the last time you used the Internet to search for health-related information; what did you do next? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

In 10 countries, at least half of the respondents say that they **spoke to friends or relatives** after using the Internet to search for health-related information. People in the Czech Republic (63%), Austria (59%) and Portugal (58%) are the most likely to have done this. Conversely, in Estonia only 22% of people spoke to friends or relatives, as did 29% in Slovenia and 30% in Cyprus.

People in Greece (50%) are the most likely to say that they **made a doctor's appointment**, followed by those in Romania (49%) and Latvia (48%). Only around a quarter of people took this approach in Finland (23%), in Croatia, Denmark and Sweden (all 25%).

In addition to **speaking with friends or relatives**, respondents in the Czech Republic also stand out as being most likely to have **taken the necessary measures to treat**

themselves (62%), to have **used the information to treat another person** (46%), and to have **spoken with others with the same condition** (43%). People in Austria (49%) are most likely to have **looked for additional information from other sources**.

Q24 Think back to the last time you used the Internet to search for health-related information; what did you do next? (MULTIPLE ANSWERS POSSIBLE)

		You spoke to friends or relatives	You made a doctor's appointment	You took the necessary measures to treat yourself (self-medication) or change your lifestyle	You used this information to help another person (spouse, child, relative, etc.)	You looked for additional information from other sources (books, magazines, TV, etc.)	You spoke to others with the same condition	You did nothing (DO NOT READ OUT)	Other (DO NOT READ OUT)	Don't know

Lowest percentage per item

Base: Respondents that used the Internet to search for health-related information within the last 12 months (N=15598)

According to the socio-demographic data:

- Women are somewhat more likely than men to say that they spoke to friends or relatives (50% vs. 44%).
- Younger respondents (15-24 year-olds) are the most likely to say that they looked for additional information from other sources (40% vs. 29-32% for other age groups) and that they spoke to friends or relatives (55% vs. 43-48%).
- Quite logically, individuals who say they don't know how to use the health-related information they find on the Internet are more likely to say that they made a doctor's appointment (51% vs. 39%).
- People who say they trust the information they find on the Internet are more likely to have used the information to help another person (38% vs. 26%).
- Respondents who think that the Internet is a good tool to help improve their knowledge of health-related topics are more inclined to have taken the necessary measures to treat themselves (37% vs. 19%) and also to have spoken with friends or relatives (48% vs. 36%).

Q24 Think back to the last time you used the Internet to search for health-related information; what did you do next? (MULTIPLE ANSWERS POSSIBLE)

	You made a doctor's appointment	You spoke to friends or relatives	You took the necessary measures to treat yourself (self-medication) or change your lifestyle	You used this information to help another person (spouse, child, relative, etc.)	You looked for additional information from other sources (books, magazines, TV, etc.)	You spoke to others with the same condition	You did nothing (DO NOT READ OUT)	Other (DO NOT READ OUT)	Don't know

IV. ALTERNATIVE SOURCES TO SEARCH FOR HEALTH-RELATED INFORMATION

The questions in this next chapter of the report were directed at respondents who did not use the Internet to search for health-related information during the past 12 months.

4.1. REASONS FOR NOT USING THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION

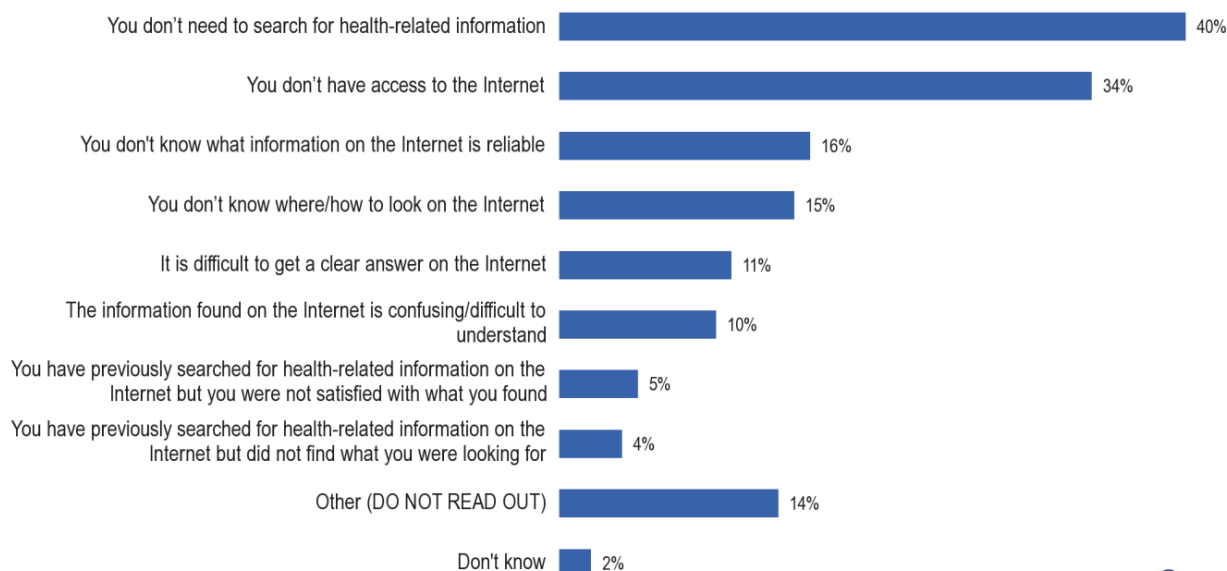

– Not needing health information and having no Internet access are the main reasons given for not having used the Internet to look for health-related information –

When asked why they didn't use the Internet to look for health-related information, four out of ten people (40%) in this group say that they simply don't need to search for health-related information, while roughly a third (34%) say that they don't have access to the Internet.

Besides these two main reasons, around one person in six say that they don't know what information on the Internet is reliable (16%) or that they don't know where or how to look on the Internet (15%). A tenth of respondents say it is difficult to get a clear answer on the Internet (11%) or that information found on the Internet is confusing (10%).

Relatively few respondents say that they did not use the Internet to search for health-related information because they did so previously and were not satisfied with what they found (5%) or that they did so previously but could not find what they were looking for (4%). 14% of people spontaneously give other reasons.

Q26. For what reasons did you not use the Internet to search for health-related information? (MULTIPLE ANSWERS POSSIBLE)

EU28

Base: Respondents who did not use the Internet to search for health-related information within the last 12 months (N=10884)

In 17 countries, a majority of people say that they did not use the Internet to search for health-related information because **they don't need to do so**. People in Denmark (65%) and the UK (60%) are the most likely to say this, while those in Romania (20%) and Hungary (24%) are the least likely.

In the other 11 Member States, a majority of people say that they **don't have access to the Internet**. At least four out of ten people give this reason in Hungary (48%), Croatia (44%), Italy (43%), Slovenia (43%), and Greece (42%). Only around a fifth of respondents say that they lack Internet access in the Netherlands (18%), Denmark (19%) and Sweden (21%).

People in the UK stand out as being the most likely to say that they **don't know what information on the Internet is reliable** (30%), that it's difficult to get a clear answer on the Internet (24%), that information found on the Internet is **confusing** (22%), and that they **searched previously but couldn't find what they were looking for** (10%).

In Malta, **not knowing where or how to look on the Internet** (28%) is the most often mentioned answer. Over a fifth of people also give this reason in Belgium and Portugal (22%). A tenth of people in Belgium (10%) also say that **they searched previously but were not satisfied with what they found**.

Q26 For what reasons did you not use the Internet to search for health-related information? (MULTIPLE ANSWERS POSSIBLE)

		You don't need to search for health-related information	You don't have access to the Internet	You don't know what information on the Internet is reliable	You don't know where/how to look on the Internet	It is difficult to get a clear answer on the Internet	The information found on the Internet is confusing/difficult to understand	You have previously searched for health-related information on the Internet but you were not satisfied with what you found	You have previously searched for health-related information on the Internet but did not find what you were looking for	Other (DO NOT READ OUT)	Don't know	Average number of answers given

Base: Respondents who did not use the Internet to search for health-related information within the last 12 months (N=10884)

The socio-demographic information shows that:

- Among respondents who did not use the Internet to search for health-related information, men are more likely than women to say that they don't need to look for health-related information (48% vs. 33%), while women are more likely to say that they don't have access to the Internet (41% vs. 26%).

- Younger respondents (15-24 year-olds) are much more likely than people aged over 55 to say that they don't need to look for health-related information (71% vs. 27%), whereas people aged over 55 are more likely to say that they don't have access to the Internet (49% vs. 6%).
- Individuals who finished their education aged 20 or over are more likely than those who left school aged 15 or under to say that they don't need to look for health-related information (49% vs. 24%). But people who left school aged 15 or under are more likely to say that they don't have access to the Internet (55% vs. 23%) and that they don't know where or how to look on the Internet (23% vs. 9%).
- Self-employed people (60%) are twice as likely as people who are not working (30%) to say that they don't need to look for health-related information. Conversely, people who are not working are the most likely to say that they don't have access to the Internet, while employees are the least likely to give this reason (46% vs. 9%).
- Respondents who say they are in a poor state of health are more likely to say that they don't have access to the Internet (52% vs. 30%).

Q26 For what reasons did you not use the Internet to search for health-related information? (MULTIPLE ANSWERS POSSIBLE)

	You don't need to search for health-related information	You don't have access to the Internet	You don't know what information on the Internet is reliable	You don't know where/how to look on the Internet	It is difficult to get a clear answer on the Internet	The information found on the Internet is confusing/difficult to understand	You have previously searched for health-related information on the Internet but you were not satisfied with what you found	You have previously searched for health-related information on the Internet but did not find what you were looking for	Other (DO NOT READ OUT)	Don't know

4.2. ALTERNATIVE SOURCES FOR HEALTH-RELATED INFORMATION

4.2.1. Frequency of search for health-related information

– Most respondents who did not use the Internet to look for health-related information did not try to find health information through any means –

Nearly two-thirds of people (63%) who did not use the Internet to look for health-related information over the past 12 months did not look for health-related information through any other means either. This is consistent with the high proportion of respondents who mentioned that they don't need to search for health-related information in the previous section. However, around a third (35%) of the people in this group say they did look for this type of information, through other means. Of these, 15% looked at least once a month, and 20% less than once a month.

Q27. Within the last 12 months, how often have you looked for health-related information, whatever the means used? This could include information on an injury, disease, illness, nutrition, improving health, etc.

Base: Respondents who did not use the Internet to search for health-related information within the last 12 months (N=10884)

In 14 countries, at least four out of ten people who did not use the Internet to search for health-related information within the last 12 months mention they looked for such information through other means. People in Slovenia (60%) are by far the most likely to have done this, followed by those in Bulgaria and Croatia (both 49%). Only around a fifth of people in Denmark (19%) and Spain (20%) say they search for health-related information elsewhere than online.

Q27 Within the last 12 months, how often have you looked for health-related information, whatever the means used? This could include information on an injury, disease, illness, nutrition, improving health, etc.

Base: Respondents who did not use the Internet to search for health-related information within the last 12 months (N=10884)

According to the socio-demographic data:

- Among respondents who did not use the Internet to search for health-related information, women are more likely than men (40% vs. 30%) to have looked for this type of information through other means.
- People who are not working (38%) are the most likely, and self-employed people (25%) the least likely, to have done this.
- Individuals who visited their doctor at least six times over the last year are more likely to have looked for health-related information through other means than online: 46%, vs. 21% of people who did not visit their doctor.

Q27 Within the last 12 months, how often have you looked for health-related information, whatever the means used?
This could include information on an injury, disease, illness, nutrition, improving health, etc.

	Once a week or more often	Several times a month	Approximately once a month	Approximately once every two months	A few times within the past year	Never	Don't know	Total 'Yes'

4.2.2. Main types of health-related information searched for

- **Most people looked for general health information or information on a specific injury or condition –**

Interestingly, the type of information looked for through means other than the Internet are very similar to the ones looked for on the Internet (ranking and proportions): indeed, half of the respondents (50%) who looked for health-related information through means other than the Internet say that they looked for general information on health-related topics.

Additionally, over four out of ten respondents (43%) looked for information on a specific injury or condition, while around a quarter (24%) looked for specific information on a medical treatment or procedure. 16% looked for a second opinion after seeing their doctor.

Q28. And what type of health-related information did you look for? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

In 21 Member States, a majority of people who searched for health-related information within the last 12 months but not on the Internet, say that they looked for **general information on health-related topics or ways to improve their health**. People in Slovenia (61%) and Hungary (59%) are the most likely to have done this, while those in Sweden (36%), Bulgaria (37%) and Denmark (37%) are the least likely to have done so.

In the other eight countries, a majority of people say that they looked for **information on a specific injury or condition**. People in Austria (60%) and Sweden (56%) are the most likely to have looked for this type of information, while those in Slovenia (24%) and Cyprus (26%) are the least likely to have done so.

Over three out of ten people in the Czech Republic (39%), Austria (32%) and Romania (30%) say that they looked for **specific information on a medical treatment or procedure**. Spain (34%) clearly stands out as the country in which most respondents mention having looked for a **second opinion after seeing their doctor**.

Q28 And what type of health-related information did you look for? (MULTIPLE ANSWERS POSSIBLE)

		General information on health-related topics or ways to improve your health	Information on a specific injury, disease/illness or condition	Specific information on a medical treatment or procedure	Information to get a second opinion after having visited your doctor	Other (DO NOT READ OUT)	Don't know

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

The socio-demographic data show that:

- Amongst respondents who searched for health-related information, but not on the Internet, women are more likely than men to have looked for all types of health-related information.
- 15-24 year-olds are the most likely to have looked for general health information (59% vs. 49-50% for the other age groups). But they are the least likely to have looked for specific information on a medical treatment or procedure (8% vs. 23-26%).
- Quite logically, people who say their state of health is good are more likely to have looked for general health information (52% vs. 45%), whereas those who say their state of health is bad are more likely to have sought specific information on a medical treatment or procedure (32% vs. 22%).
- Respondents who visited their doctor at least six times over the past 12 months are more likely than people who didn't see their doctor at all, to have looked for specific information on a medical treatment or procedure (32% vs. 18%), but less likely to have looked for general health information (52% vs. 47%).

Q28 And what type of health-related information did you look for? (MULTIPLE ANSWERS POSSIBLE)

4.2.3. Main sources of health-related information

– Most people who did not use the Internet to find health information say they usually ask their doctor when they need such information –

People who used means other than the Internet to look for health-related information were asked what they usually do when they need such information.

Asking their doctor is by far the most often mentioned answer, by around eight out of ten people (79%). Additionally, around half (48%) say that they watch medical programmes or documentaries on TV. Over four out of ten people also say that they read newspapers or magazines (44%), or ask friends or relatives or others (41%). Nearly three out of ten people (29%) say that they read books, while a fifth (21%) listen to medical programmes or documentaries on the radio.

Q29. When you need to search for health-related information, what do you usually do? (MULTIPLE ANSWERS POSSIBLE)

EU28

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

In all but one Member State, a majority of people who searched for health-related information elsewhere than on the Internet say that they **ask their doctor** when they need health-related information. The exception is Hungary, where more respondents watch medical programmes or documentaries on TV (56% vs. 49%). People in Portugal and Spain (both 88%) are the most likely to say that they ask their doctor, while those in Hungary and Slovakia (both 49%) are the least likely.

In nine countries, at least 50% of people say that they **watch medical programmes or documentaries on TV**, with people in Portugal (67%) and Luxembourg (64%) the most likely to do this. Respondents in Cyprus (17%) and Slovenia (27%) are relatively unlikely to obtain their information in this way.

In eight Member States, at least 50% of people say that they **read newspapers or magazines** to search for health-related information. People in Austria (67%) and Finland (60%) are the most likely to do this, while those in Greece (18%) and Malta (22%) are the least likely to do so.

People in the Czech Republic (59%) and Austria (58%) are the most likely to **ask friends, relatives or other people**, while those in Malta (18%), Estonia (24%) and Greece (24%) are the least likely to do so.

Finally, respondents in Austria (44%) are the most likely to seek health-related information in **books**, while those in Estonia (36%) are the most likely to say they **listen to medical programmes or documentaries on the radio**.

Q29 When you need to search for health-related information, what do you usually do? (MULTIPLE ANSWERS POSSIBLE)

		You ask your doctor	You watch medical programmes or documentaries on the TV	You read newspapers or magazines	You ask your friends, relatives or other people	You read books or encyclopaedias	You listen to medical programmes or documentaries on the radio	You never need to search for health-related information (DO NOT READ OUT)	Other (DO NOT READ OUT)	Don't know

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

The socio-demographic data show that:

- Among respondents who searched for health-related information elsewhere than on the Internet, women are more likely than men to use most sources of health-related information.
- People aged 55 and over are more likely to source information from newspapers and magazines (52% vs. 22% of 15-24 year-olds), from radio programmes (27% vs. 3%), and from TV programmes (56% vs. 21%).
- People with a higher level of education are more likely to look for information in books or to ask friends and relatives, while those with a lower level of education are more likely to rely on TV programmes.
- Respondents who are not working (53%) or who are manual workers (52%) are much more inclined to source medical information from TV programmes than self-employed people (28%) or employees (34%).
- Individuals who say they are in a poor state of health are more likely to say they usually read newspapers or magazines (54% vs. 42%) or watch medical TV programmes (60% vs. 45%).

Q29 When you need to search for health-related information, what do you usually do? (MULTIPLE ANSWERS POSSIBLE)

	You ask your doctor	You watch medical programmes or documentaries on the TV	You read newspapers or magazines	You ask your friends, relatives or other people	You read books or encyclopaedias	You listen to medical programmes or documentaries on the radio	You never need to search for health-related information (DO NOT READ OUT)	Other (DO NOT READ OUT)	Don't know

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

4.2.4. Person for whom the information was searched

– A large majority of people searching for health information through other means than the Internet are looking on their own behalf –

A substantial majority (83%) of people who tried to find information on health by means other than the Internet mention they did so for themselves. Additionally, around three out of ten people say they were looking on behalf of their spouse or partner (31%), their children (28%), or other members of their family (28%). Roughly an eighth of respondents (13%) were looking for a friend or colleague.

Q30. When trying to find information on health, for whom do you usually search this type of information? (MULTIPLE ANSWERS POSSIBLE)

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

In all Member States, at least 65% of people who were trying to find information on health by means other than the Internet say that they were **looking for themselves**. The proportion of respondents who did so ranges from 93% in Estonia and 90% in Finland, to 65% in Cyprus and 69% in the Netherlands.

At least four out of ten people in Austria (47%), Cyprus (42%) and Romania (40%) say they were looking on behalf of **their spouse or partner**. In contrast, relatively fewer people did so in Sweden (15%) or Latvia (17%).

People in France (40%) and Portugal (39%) are most likely to say they were looking on behalf of **their children**, while respondents in Greece (44%) and also in Belgium and Portugal (both 41%) are the most likely to say they were looking for **other members of their family**. Finally, 23% of people in both Belgium and Luxembourg say they were looking for **a friend or colleague**.

Lowest percentage per item

Base: Respondents who searched for health-related information within the last 12 months but not on the Internet (N=3833)

According to the socio-demographic data:

- Amongst respondents who tried to find health-related information by means other than the Internet, women are more likely than men to search for their children (32% vs. 23%) or for other members of their family (30% vs. 25%).
- Unsurprisingly, respondents aged 40-54 are the most likely to look for health-related information for their children, while 15-24 year-olds are the least likely to do this (42% vs. 3%).
- Individuals who visited their doctor at least six times last year are more likely than people who did not visit their doctor at all to have looked for information for themselves (88% vs. 67%).

**Q30 When trying to find information on health, for whom do you usually search this type of information?
(MULTIPLE ANSWERS POSSIBLE)**

4.3. LIKELINESS TO USE THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION IN THE FUTURE

- **Two-thirds of people who did not use the Internet previously to look for health-related information say they are also unlikely to use the Internet in the future –**

Less than one third (29%) of people who did not previously use the Internet to look for health-related information say that they would be likely to use the Internet next time they want to find information on health-related topics.

Over two-thirds of people (68%) say they are unlikely to use the Internet, and most of these (51%) say they are not at all likely to do so.

Q31. Next time you want to get information on health-related questions, how likely are you to use the Internet?

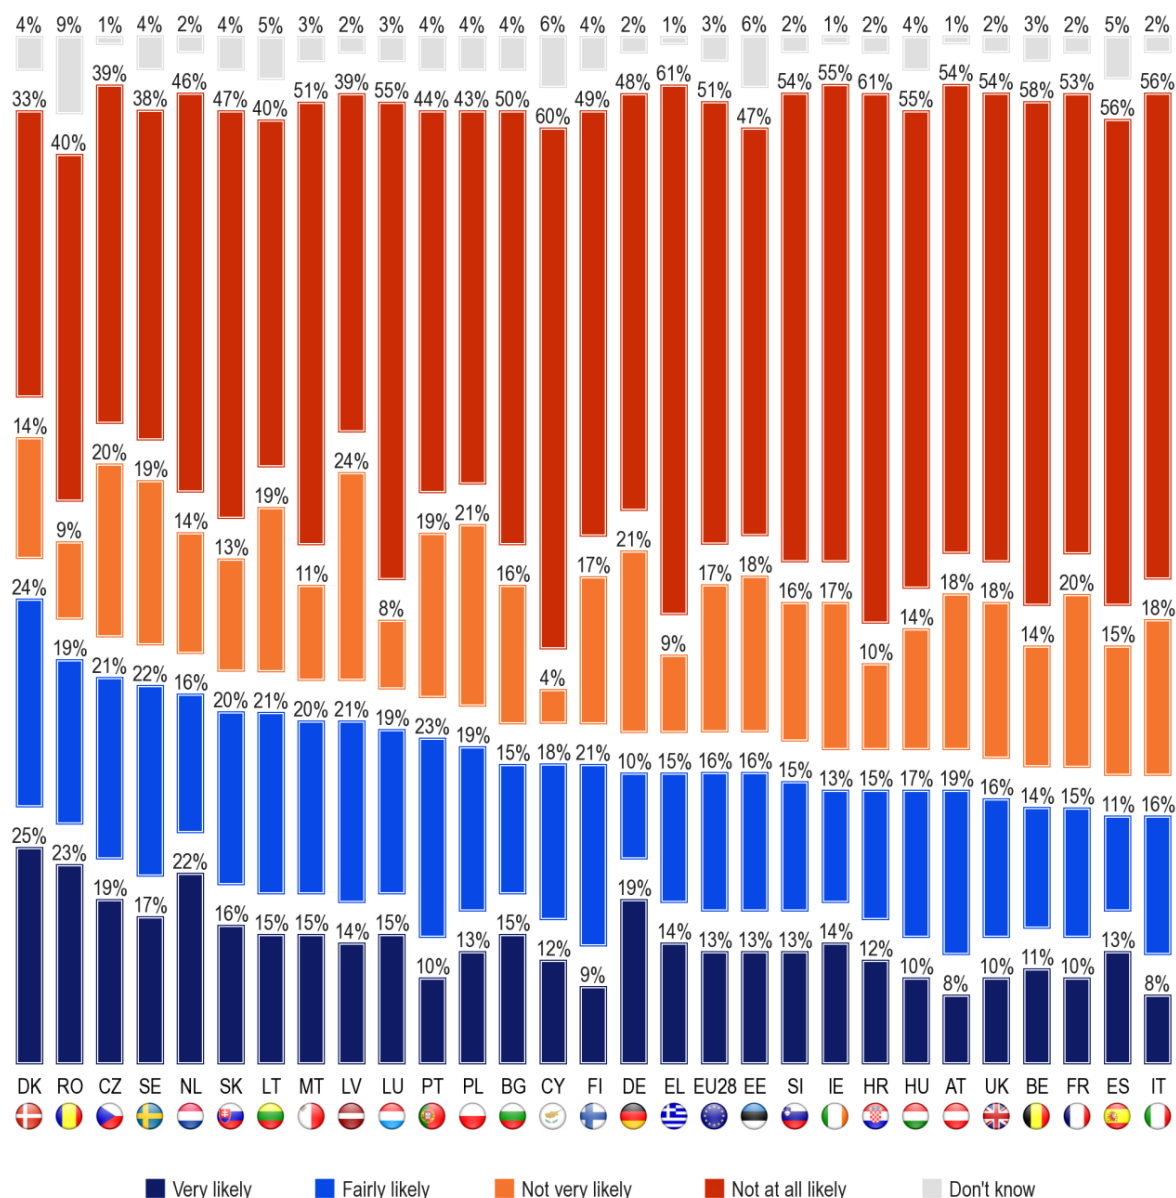

- Very likely
- Fairly likely
- Not very likely
- Not at all likely
- Don't know

 EU28

Base: Respondents who did not use the Internet to search for health-related information within the last 12 months (N=10884)

In only three Member States at least four out of ten people say they are likely to use the Internet next time: Denmark (49%), Romania (42%) and the Czech Republic (40%). In other Member States, relatively few respondents say they would use the Internet next time, with the lowest proportion observed in Italy and Spain (both 24%). In 15 countries, at least 50% of respondents say they are not at all likely to use the Internet next time, with people in Croatia and Greece (both 61%) the most inclined to say this.

Q31. Next time you want to get information on health-related questions, how likely are you to use the Internet?

Base: Respondents who did not use the Internet to search for health-related information within the last 12 months (N=10884)

The socio-demographic data show that:

- Among respondents who did not use the Internet to search for health-related information within the last 12 months, men are more likely than women (34% vs. 24%) to say that they are likely to use the Internet next time.
- Younger respondents (15-24 year-olds) are the most likely, and people aged 55 and over the least likely, to say they would use the Internet next time (52% vs. 19%).
- Nearly half of the people (46%) who think the Internet is a good tool to help improve their knowledge of health-related topics say they are likely to use it next time to find health-related information, compared with only 7% of respondents who don't.

- 40% of people who did not visit their doctor over the last 12 months say they are likely to use the Internet next time, as opposed to 22% of individuals who visited their doctor six times or more.

V. SEARCH FOR HEALTH-RELATED INFORMATION: COMPARISON BETWEEN THE INTERNET AND ALTERNATIVE MEANS

5.1. MAIN TYPE OF INFORMATION SEARCHED

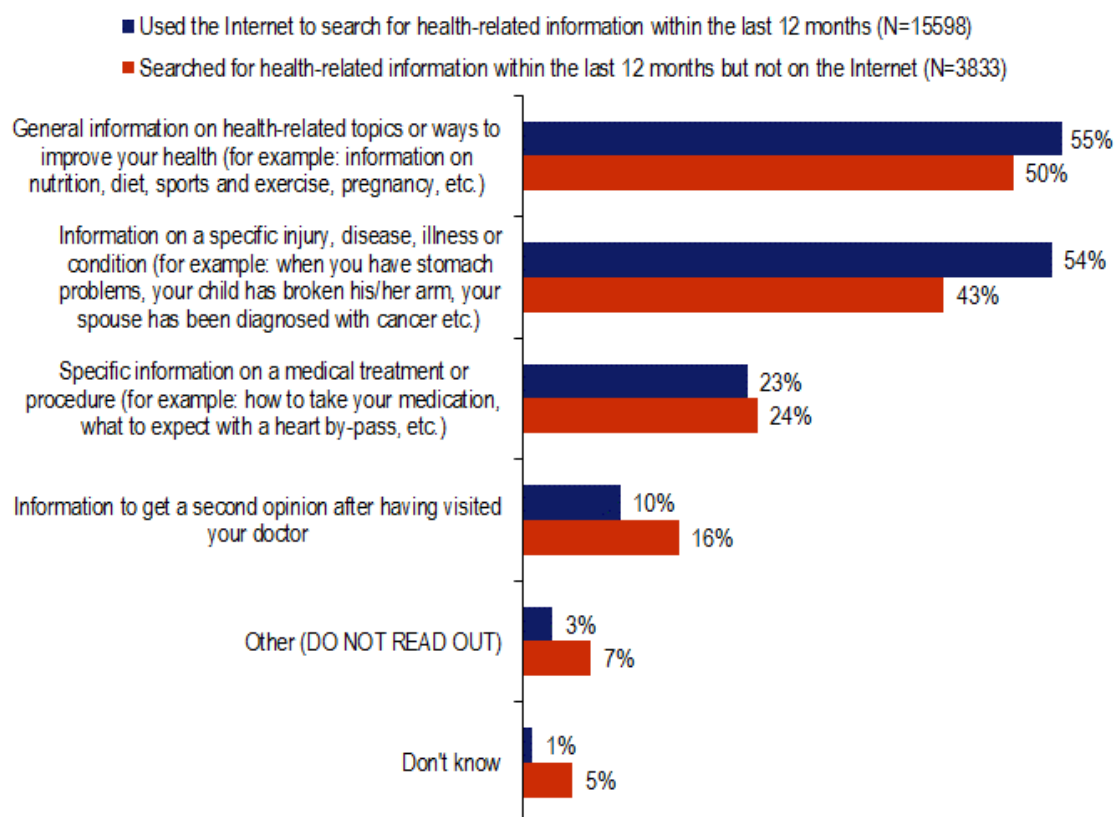

- **The type of health-related information searched for is quite similar, whether it was through the Internet or via other means –**

This section of the report compares the responses of people who say they used the Internet to search for health information, with those who searched for health information by other means. As indicated in each graph, the bases of these two segments are quite different, with the former being much larger than the latter.

People who used the Internet (55%) are more likely to have looked for general health-related information than those who did not use the Internet (50%). Respondents who used the Internet (54% vs. 43%) are also more likely to have looked for information on a specific injury or condition.

There is little difference between the two groups (23% vs. 24%) when it comes to searching for information on a specific treatment or procedure. However, respondents who did not use the Internet (16% vs. 10%) are more likely to say they looked for a second opinion.

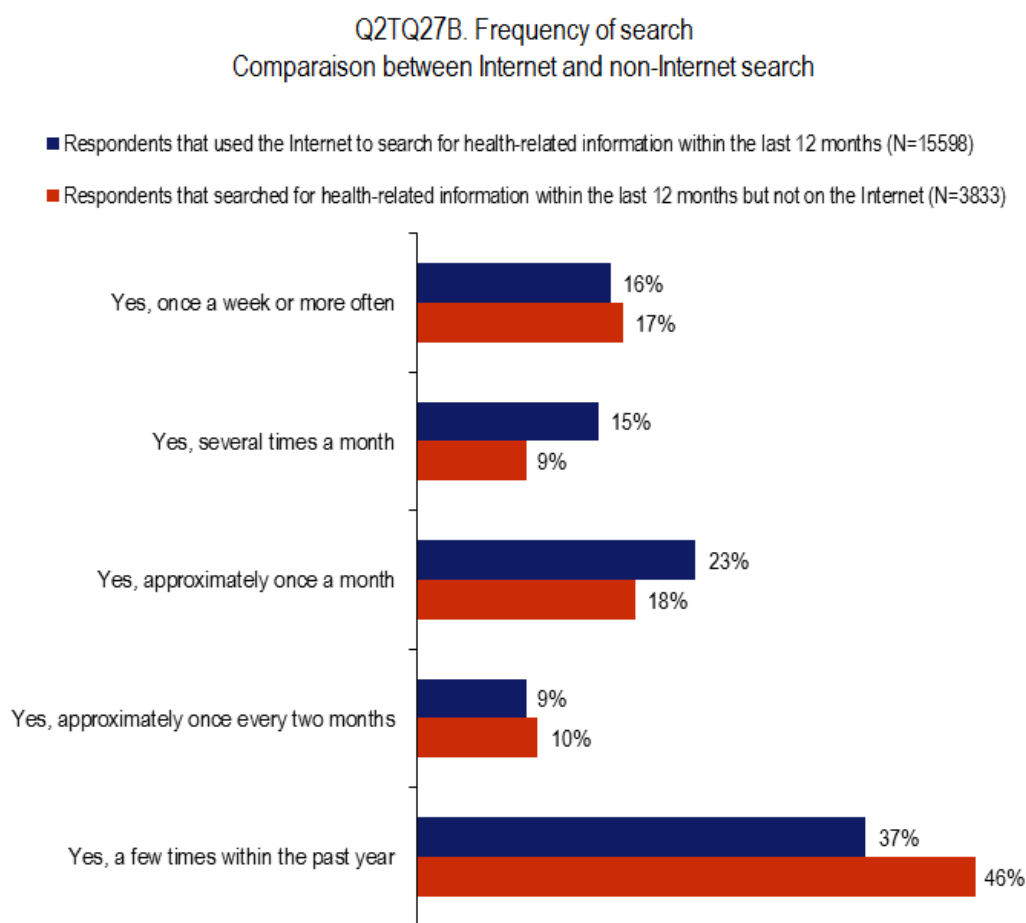

Q3Q28. Type of health-related information searched (MAX. TWO ANSWERS) - % EU

5.2. FREQUENCY OF SEARCH

– Overall, people searching for health-related information on the Internet do so on a more frequent basis than those searching through other means –

The proportion of respondents who searched for health-related information on a weekly basis is very similar, whether they did so via the Internet or through other means (once a week or more often: 16% vs. 17% resp.). However, people who used the Internet to search for information are more likely than respondents who searched in other ways to have done so several times a month (15% vs. 9%) or approximately once a month (23% vs. 18%). Respondents who used other means of searching besides the Internet are more likely to have looked for health information only a few times over the past year (46% vs. 37%).

Base: Respondents who used the Internet within the last 12 months for private purposes (N=21206)

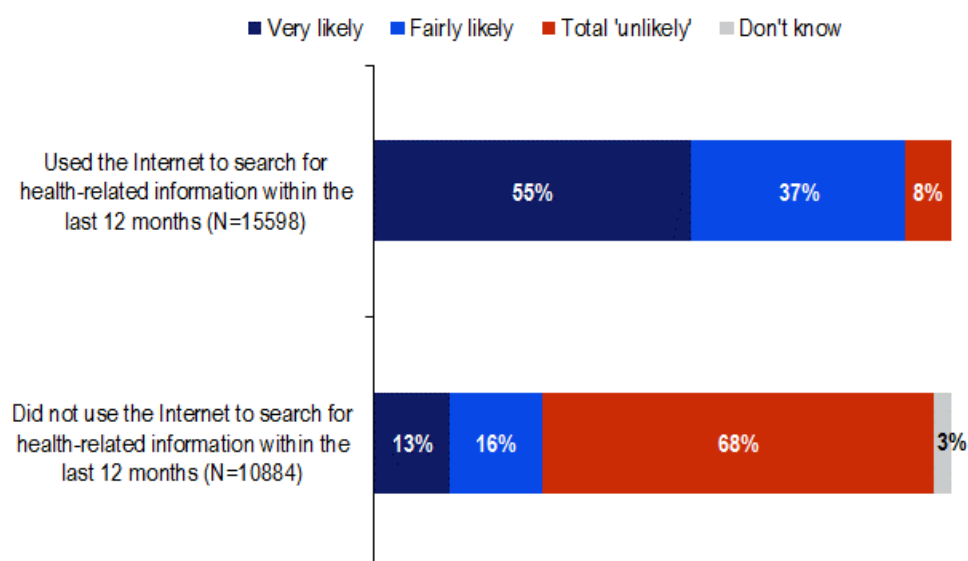

5.3. LIKELINESS TO USE THE INTERNET TO SEARCH FOR HEALTH-RELATED INFORMATION IN THE FUTURE

- While those who have already searched for health-related information on the Internet seem quite convinced, those who haven't don't appear very likely to do so in the future –

People **who used the Internet** to look for health-related information during the last 12 months are highly likely to say that they would do so in the future: 92% say they are likely to do this, of which 55% are very likely to do so, while only 8% think they are unlikely to use the Internet again. This finding is consistent with the very high level of satisfaction observed in section III of this report.

In contrast, only around three out of ten people (29%) who **did not use the Internet** previously say they are likely to use it in the future. Over two-thirds of people (68%) in this group feel that they are unlikely to use the Internet in the future. In order to convince them to use the Internet, the main barriers detailed in section IV will have to be overcome: besides the lack of Internet access, some reassurance about the reliability of the information found on the Internet, as well as some kind of education about where and how to look for health-related information on the Internet are needed to convince these respondents to use the Internet in the future.

Q25Q31. Likelihood to use the Internet to search for health-related information in the future - % EU

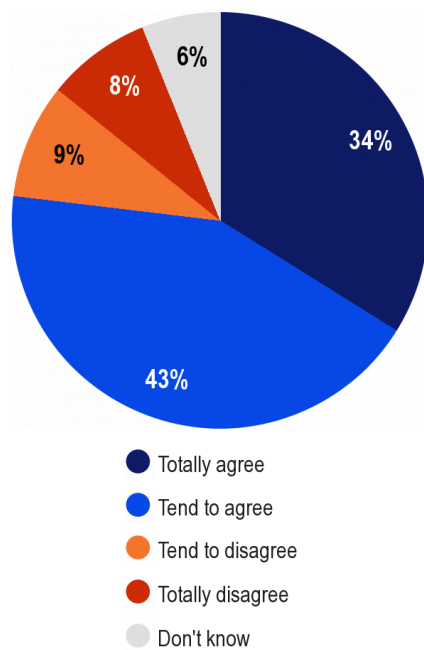

VI. CITIZENS' HEALTH-RELATED KNOWLEDGE AND INFORMATION ON CITIZENS' HEALTH

6.1. PERCEPTION OF INTERNET AS A TOOL TO IMPROVE KNOWLEDGE OF HEALTH-RELATED TOPICS

– Over three-quarters of people feel that the Internet is a good tool for improving their knowledge of health topics –

Over three-quarters of respondents (77%) agree that the Internet is a good tool for improving their knowledge of health-related topics, with 34% totally agreeing, and 43% tending to agree. Just 17% of people do not agree that the Internet is a good tool for this.

Q32. Please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree with the following statement: "The Internet is a good tool to help improve my knowledge of health-related topics"

 EU28

Base: All respondents

In all but five Member States, at least three quarters of people agree that the Internet is a good tool for improving their knowledge of health-related topics. The level of agreement on this point is highest in Sweden (87%), Denmark (87%), and Ireland (86%). Only 68% of people in Germany agree, however, as do 72% in both Belgium and Spain.

At least a fifth of people do not think that the Internet is a good tool in Belgium (23%), Germany (23%), Austria (22%), France (22%) and Spain (21%).

Q32. Please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree with the following statement: "The Internet is a good tool to help improve my knowledge of health-related topics"

Base: All respondents

The socio-demographic data show that:

- People aged 55 and over are much less inclined to think that the Internet is a good tool than people in younger age groups (63% vs. 82-86%).
- Respondents who finished their education aged 20 or above are more likely to say that the Internet is a good tool than those who left school aged 15 or under (81% vs. 58%).
- Unsurprisingly, while 83% of people who used the Internet for private purposes during the last 12 months say that the Internet is a good tool, only 52% of people who did not use it agree.
- Interestingly, while almost all respondents (98%) who say they trust the information they find online think that the Internet is a good tool, this proportion also remains very high (81%) amongst people who do not trust the information they find online.
- 80% of respondents who say they have good knowledge of health-related topics think that the Internet is a good tool, as opposed to 68% of people say their knowledge is poor.

Q32 Please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree with the following statement: "The Internet is a good tool to help improve my knowledge of health-related topics"

Base: All respondents

6.2. PERCEIVED LEVEL OF KNOWLEDGE OF HEALTH-RELATED TOPICS**– Around eight out of ten respondents feel that they have a good knowledge of health-related topics –**

Around eight out of ten people (79%) say that they have good general knowledge of health-related topics, most of these (67%) assessing this knowledge level to be fairly good. Less than a fifth of respondents (18%) say that their knowledge of health-related topics is bad.

Q36. How would you assess your general knowledge of health-related topics? Would you say it is...?

- Very good
- Fairly good
- Total 'bad'
- Don't know

 EU28

Base: All respondents

In 22 out of 28 Member States, over 80% of people feel that they have good knowledge of health-related topics. People in the UK (90%) are most likely to say this, followed by those in Malta (89%), those in Spain, Ireland, Cyprus and in the Netherlands (all 88%).

However, a relatively higher proportion of people in the remaining six countries consider their knowledge of health-related topics as good: 52% of people in Poland feel that their knowledge is good, followed by 68% in Latvia, 73% in France, 74% in Estonia, 75% in Italy and 76% in Lithuania.

Q36. How would you assess your general knowledge of health-related topics? Would you say it is...?

Base: All respondents

According to the socio-demographic data:

- Women are somewhat more likely than men (83% vs. 77%) to feel that they have good knowledge of health-related topics.
- Respondents with a higher level of education are rather more likely to say that they have good knowledge of health-related topics (82% vs. 76%).
- While 84% of employees say that their level of knowledge is good, only 73% of manual workers do so.
- Among those who have used the Internet to search for health-related information, the proportion of those who assess their general knowledge of health-related topics to be 'good' is slightly higher than among those who have not used the Internet to search for this kind of information (83% vs. 77%).
- 84% of people who say they know how to navigate the Internet believe that they have good knowledge of health-related topics, as opposed to 64% of people who say they do not know how to navigate the Internet.
- While 81% of people who say they are in a good state of health think that they have good knowledge of health-related topics, only 71% of respondents who say they are in a poor state of health give this answer.

Q36 How would you assess your general knowledge of health-related topics? Would you say it is...?

6.3. PERCEIVED LEVEL OF HEALTH IN GENERAL

– Nearly 90% of Europeans consider they are in good health –

Nearly nine out of ten respondents (88%) say that their level of health is good, with 28% assessing it as very good and 60% as fairly good. Just 10% of people say their level of health is bad.

Q33. How would you rate your level of health in general? Would you say it is...?

- Very good
- Fairly good
- Total 'bad'
- Don't know

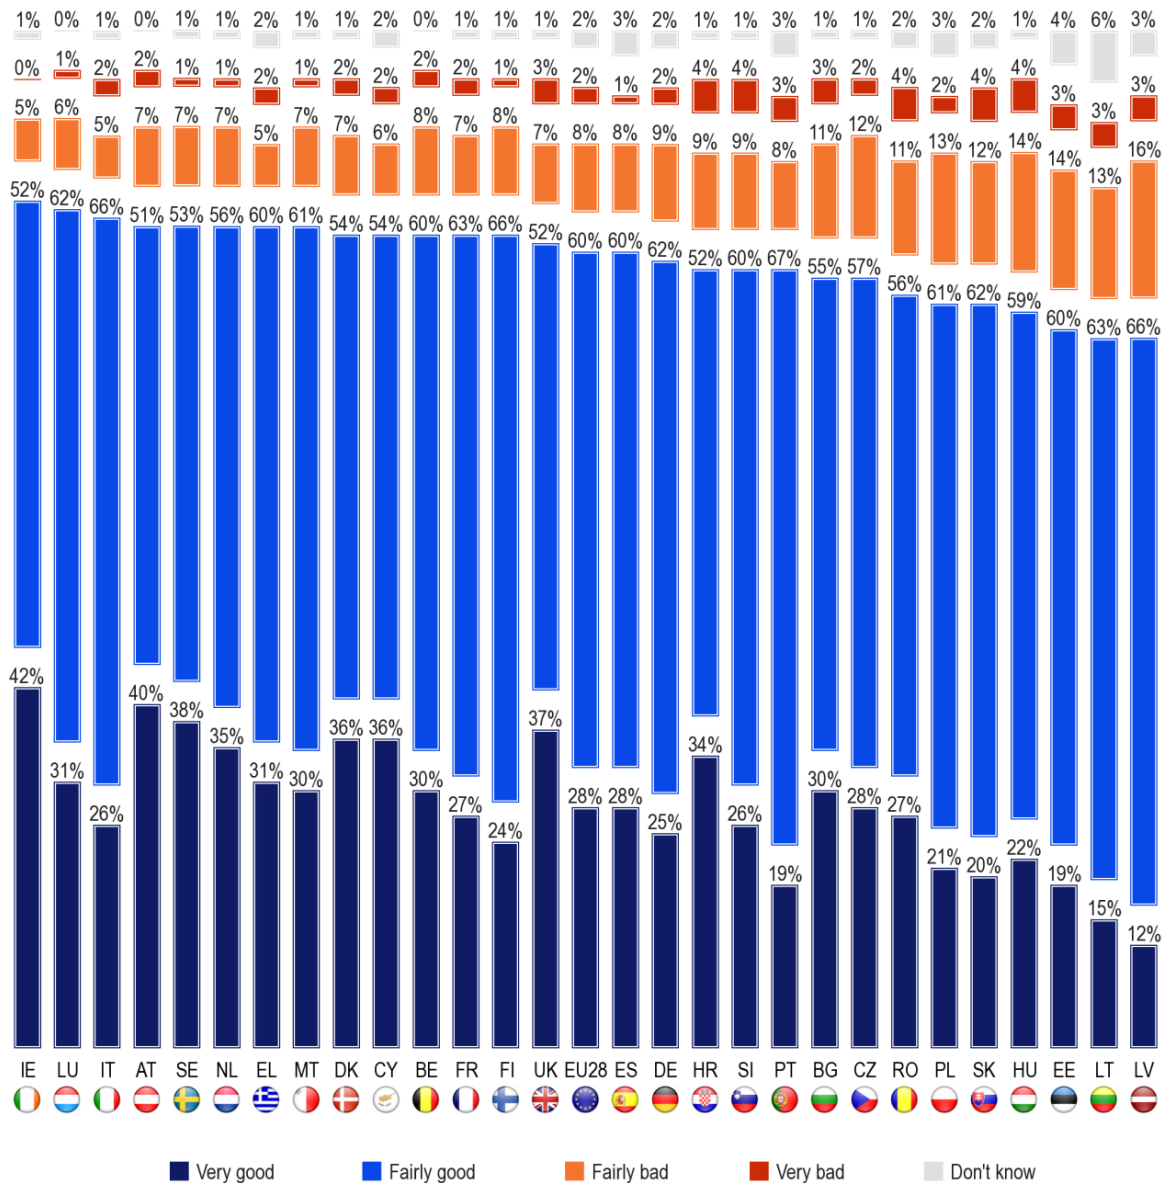

EU28

Base: All respondents

In 13 Member States, at least 90% of people consider their level of health in general as good. Respondents in Ireland (94%), Luxembourg (93%) and Italy (92%) are the most likely to say this. Respondents in Ireland (42%) and Austria (40%) are the most likely to consider that their level of health is even very good.

At the other end of the scale, less than 80% of people say their health is good in three countries: Latvia (78%), Lithuania (78%) and Estonia (79%).

Q33. How would you rate your level of health in general? Would you say it is...?

Base: All respondents

The socio-demographic data show that:

- Almost all 15-24 year-olds (96%) say their health is good, compared to 80% of people aged 55 and over.
- While 95% of employees say that their health is good, only 82% of people who are not working feel this way.
- Unsurprisingly, while 96% of respondents who did not visit their doctor at all over the past 12 months say they are in good health, only 69% of people who visited their doctor six times or more say this.

Q33 How would you rate your level of health in general? Would you say it is...?

6.4.EXISTENCE OF LONG-TERM DISEASES OR HEALTH PROBLEMS**– Nearly four out of ten respondents say that they have a long-term disease or health problem –**

Around four out of ten respondents (38%) mention having a long-term disease or health problem, of which 25% say they have one health problem and 13% say they have multiple problems. Conversely, six out of ten respondents (61%) have no long-term problems. Conversely, six out of ten respondents (61%) have no long-term problems.

Q34. Do you have any long-term disease or a health problem? By long term, I mean a problem which has lasted or is expected to last for 6 months or longer.

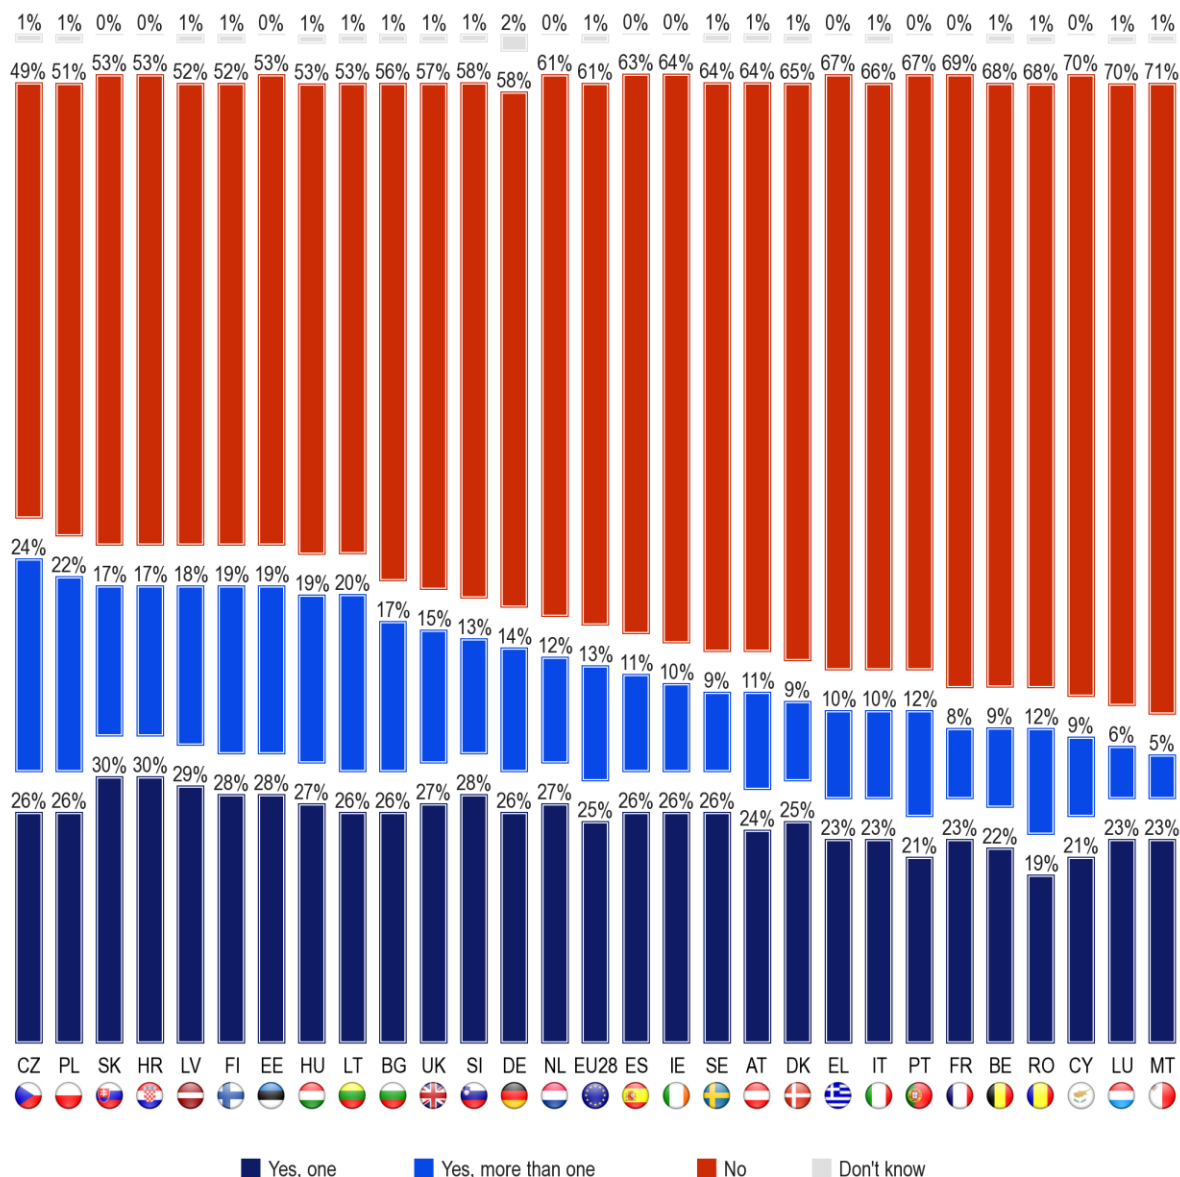

- Yes, one
- Yes, more than one
- No
- Don't know

 EU28

Base: All respondents

In 13 countries, at least four out of ten respondents say that they have at least one long-term health problem. People in the Czech Republic (50%) are the most likely to say this, followed by those in Poland (48%), and in Slovakia, Croatia, Latvia, Finland and Estonia (all 47%). At the other end of the scale, only 28% of people in Malta declare suffering from at least one long-term health problem, followed by 29% in Luxembourg and 30% in Cyprus.

Q34. Do you have any long-term disease or a health problem? By long term, I mean a problem which has lasted or is expected to last for 6 months or longer.

Base: All respondents

According to the socio-demographic data:

- Women are more likely than men (41% vs. 35%) to say that they have one or several long-term health problems.
- Quite logically, 55% of people aged 55 and over mention having a long-term health problem, while this proportion falls to 19% among 15-24 year-olds.

- Over half (53%) of people who left school aged 15 or under say they have a long-term health problem, compared with around a third (35%) of those who finished their education aged 20 or over.
- Unsurprisingly, people who are not working (47%) are more likely to say they have a long-term health problem than employees or self-employed people (both 29%).
- A higher proportion of individuals who did not use the Internet for private purposes over the past year declare having a long-term health problem (55% vs. 34% of those who used the Internet).
- As could be expected, 73% of people who visited their doctor at least six times over the past year mention having a long-term health problem, compared with 15% of people who did not visit their doctor at all.

Q34 Do you have any long-term disease or a health problem? By long term, I mean a problem which has lasted or is expected to last for 6 months or longer.

6.5.FREQUENCY OF VISITS TO THE DOCTOR**– 85% of people visited their doctor at least once during the past year –**

A substantial majority of Europeans (85%) say they have personally visited their doctor over the last 12 months. Of these, 38% went 1 or 2 times, 25% went 3 to 5 times, and 22% went six times or more. Just 14% of respondents did not go to the doctor at all.

Q35. How many times have you personally been to the doctor within the last 12 months?

- Never
- 1-2 times
- 3-5 times
- 6 times or more
- Don't know

 EU28

Base: All respondents

People in Austria, Luxembourg and Germany (all 90%) are the most likely to say that they visited their doctor at least once, with those in Poland (32%) and Hungary (30%) being the most likely to say that they went six times or more.

Conversely, respondents in Sweden (28%), the Netherlands (23%), Slovenia (22%) and Romania (22%) are the most likely to say that they did not visit their doctor at all.

Base: All respondents

The socio-demographic data show that:

- Women are somewhat more likely than men (88% vs. 81%) to say they visited their doctor at least once within the last year.
- Respondents who are not working (89%) are the most likely to say that they saw their doctor at least once, while self-employed people (75%) are the least likely to have done so.
- Unsurprisingly, 95% of people who say their state of health is poor went to see their doctor at least once, as opposed to 83% of people who say their health is good.

Q35 How many times have you personally been to the doctor within the last 12 months?

	Never	1-2 times	3-5 times	6 times or more	Don't know

6.6.FREQUENCY OF EXERCISING OR PLAYING SPORTS**– Nearly two-thirds of people say they exercise at least once a week –**

Just under two-thirds of Europeans (63%) say that they exercise at least once a week, and 77% say they exercise sometimes. Of these, 19% exercise five times a week or more, 19% do so 3-4 times a week, 25% do so 1-2 times a week, and 14% exercise less than once a week. Roughly a fifth of respondents (22%) say they never exercise.

Q37. How often do you exercise or play sports? By 'exercise', I mean any form of physical activity which you do in a sports context or sports-related setting, such as swimming, training in a fitness centre or a sports club, running in the park etc.

Base: All respondents

People in Finland (84%) are the most likely to say that they exercise once a week or more, followed by those in Ireland and Austria (both 79%). At least three out of ten people exercise five times a week or more in Latvia (32%), as well as in Ireland and Malta (both 31%).

In contrast, only 45% of people in Romania say they exercise once a week or more, as do 50% in Croatia and 52% in Bulgaria. In Romania, 40% of people say they never exercise.

Q37 How often do you exercise or play sports? By 'exercise', I mean any form of physical activity which you do in a sports context or sports-related setting, such as swimming, training in a fitness centre or a sports club, running in the park etc.

ANNEXES

TECHNICAL SPECIFICATIONS

FLASH EUROBAROMETER 404

"European citizens' digital health literacy"

TECHNICAL SPECIFICATIONS

Between the 18 and the 20 of September 2014, TNS Political & Social, a consortium created between TNS political & social, TNS UK and TNS opinion, carried out the survey FLASH EUROBAROMETER 404 about "European citizens' digital health literacy".

This survey has been requested by the EUROPEAN COMMISSION, Directorate-General for Communication Networks, Content and Technology (DG CONNECT). It is a general public survey co-ordinated by the Directorate-General for Communication (DG COMM "Strategy, Corporate Communication Actions and Eurobarometer" Unit). The FLASH EUROBAROMETER 404 covers the population of the respective nationalities of the European Union Member States, resident in each of the 28 Member States and aged 15 years and over. All interviews were carried using the TNS e-Call center (our centralized CATI system). In every country respondents were called both on fixed lines and mobile phones. The basic sample design applied in all states is multi-stage random (probability). In each household, the respondent was drawn at random following the "last birthday rule".

TNS has developed its own RDD sample generation capabilities based on using contact telephone numbers from responders to random probability or random location face to face surveys, such as Eurobarometer, as seed numbers. The approach works because the seed number identifies a working block of telephone numbers and reduces the volume of numbers generated that will be ineffective. The seed numbers are stratified by NUTS2 region and urbanisation to approximate a geographically representative sample. From each seed number the required sample of numbers are generated by randomly replacing the last two digits. The sample is then screened against business databases in order to exclude as many of these numbers as possible before going into field. This approach is consistent across all countries.

Readers are reminded that survey results are estimations, the accuracy of which, everything being equal, rests upon the sample size and upon the observed percentage. With samples of about 1,000 interviews, the real percentages vary within the following confidence limits:

Q21.9 Pour chacune des propositions suivantes, veuillez me dire si vous êtes tout à fait d'accord, plutôt d'accord, plutôt pas d'accord ou pas du tout d'accord.

Après avoir fait des recherches en ligne pour trouver des informations sur des questions relatives à la santé, vous êtes en général encore plus embrouillé(e)

Q21.9 For each of the following statements please tell me whether you totally agree, tend to agree, tend to disagree or totally disagree.

After looking online to find information on health-related topics, you are generally more confused than before

Q21.9 Bitte sagen Sie mir für jede der folgenden Aussagen, ob Sie ihr voll und ganz zustimmen, eher zustimmen, eher nicht zustimmen oder überhaupt nicht zustimmen.

Nachdem Sie versucht haben, im Internet Informationen zu gesundheitsbezogenen Themen zu finden, sind Sie in der Regel noch verwirrter als zuvor

	%	Tout à fait d'accord	Plutôt d'accord	Plutôt pas d'accord	Pas du tout d'accord	NSP/SR	Total d'accord"	Total pas d'accord"

Q37 A quelle fréquence faites-vous de l'exercice ou du sport ? Par « exercice », j'entends toute forme d'activité physique que vous pratiquez dans un contexte sportif ou dans un environnement en rapport avec le sport, comme la natation, un entraînement dans un centre de fitness ou un club de sport, la course à pied dans un parc, etc.

Q37 How often do you exercise or play sports? By 'exercise', I mean any form of physical activity which you do in a sports context or sports-related setting, such as swimming, training in a fitness centre or a sports club, running in the park etc.

Q37 Wie oft bewegen Sie sich oder treiben Sie Sport? Mit 'bewegen' meine ich jede Form körperlicher Aktivität in einem sportlichen Kontext oder einer Sportumgebung, wie z. B. Schwimmen, Training in einem Fitness- oder Sportclub, Joggen im Park etc.
